Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 XX DNA encoding antigenic peptide(s) of new types of hepatitis C virus - for
 PT diagnosing and treating HCV infection, screening blood samples and
 PT identifying different HCV types.
 XX Disclosure; Fig 9b; 120pp; English.
 XX The sequences given in AAR37932-37 show amino acids 1638-1765 of the NS4
 CC region of hepatitis C virus-3 (HCV-3) samples from 5 blood donors and a
 CC consensus sequence. Analysis of this and other regions of the HCV genome
 CC revealed the existence of three distinct groups of HCV. Analysis of the
 CC region encompassing -255 to -62 of the 5' non coding region (see AAQ43058
 CC -73) showed a difference of 9-14% in the nucleotide sequences between the
 CC three groups. Two of the groups identified were similar to those of HCV
 CC variants termed type 1 and 2, whilst the third appeared to represent a
 CC novel type of virus. Comparison of the NS3 region (see AAR37927-30)
 CC showed a high degree of sequence diversity with type 3 being
 CC phylogenetically different to type 1 and 2. The same degree
 CC differentiation was noted in the NS-5 (see AAR37923-26) and core region
 CC between type 3 and type 1 sequences. (Updated on 25-MAR-2003 to correct
 CC PN field.)

XX
XX DNA encoding antigenic peptide(s) of new types of hepatitis C virus - for
PT diagnosing and treating HCV infection, screening blood samples and
PT identifying different HCV types.
XX
PS Disclosure; Fig 9b; 120pp; English.
XX
XX The sequences given in AAR37932-37 show amino acids 1638-1765 of the NS4
CC region of hepatitis C virus-3 (HCV-3) samples from 5 blood donors and a
CC consensus sequence. Analysis of this and other regions of the HCV genome
CC revealed the existence of three distinct groups of HCV. Analysis of the
CC region encompassing -255 to -62 of the 5' non coding region (see AAQ43058
CC -75) showed a difference of 9-14% in the nucleotide sequences between the
CC three groups. Two of the groups identified were similar to those of HCV
CC variants termed type 1 and 2, whilst the third appeared to represent a
CC novel type of virus. Comparison of the NS3 region (see AAR37927-30)
CC showed a high degree of sequence diversity with type 3 being
CC phylogenetically different to type 1 and 2. The same degree
CC differentiation was noted in the NS-5 (see AAR37923-26) and core region
CC between type 3 and type 1 sequences. (Updated on 25-MAR-2003 to correct
CC PN field.)

XX Identifying a candidate peptide epitope, which induces a HLA class I CTL
PT response comprises identifying variants of a peptide epitope 8-11 amino
PT acids in length comprising primary anchor residues of the same HLA class
PT I binding motif.
XX
PS Disclosure; Page 388-440; 458pp; English.
XX
XX The invention relates to a method of identifying a candidate peptide
CC epitope which induces an HLA class I CTL response against variants of the
CC peptide epitope, comprising identifying, from a particular antigen of an
CC infectious agent, variants of a peptide epitope comprising primary anchor
CC residues of the same HLA class I binding motif. The method is useful for
CC identifying a candidate peptide epitope, which induces an HLA class I CTL
CC response against variants of the peptide epitope. This sequence
CC represents an HCV polymerase protein used in the scope of the invention.

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

XX New polynucleotide sequences from hepatitis C virus - and related
vectors, polypeptide(s) and antibodies, useful for immunisation,
treatment, diagnosis and typing of HCV isolates.

PS Claim 11; Page 125; 404pp; English.

XX Compositions comprising at least 5, and pref. 8 or more contiguous
nucleotides selected from an HCV type 3 genomic sequence, more
particularly (i) the region spanning positions 417-957 of the Core/E1
region of HCV subtype 3a; (ii) the region spanning positions 4664-4730 of
the NS3 region of HCV type 3; (iii) the region spanning positions 4892-
5292 of the NS3/4 region of HCV type 3; (iv) the region spanning
positions 8023-8235 of the NS5 region of the BR36 subgroup of HCV subtype
3a; or (v) an HCV subtype 3c genomic sequence, may be used as primers to
amplify nucleic acid from an isolate belonging to a specific genotype, or
as a probe for specific detection/classification of nucleic acid.
XX Polypeptides encoded by the nucleotides in such compositions may be used
for immunisation against HCV, for the detection of antibodies directed
against HCV and for serotyping. This sequence corresponds to the NS3/NS4
region of HCV subtype 3a and is taken from a clone designated BR36-20-
164. (Updated on 25-MAR-2003 to correct PN field.)

XX DNA encoding antigenic peptide(s) of new types of hepatitis C virus - for
diagnosing and treating HCV infection, screening blood samples and
identifying different HCV types.

PS Disclosure; Fig 9b; 120pp; English.

XX The sequences given in AAR37932-37 show amino acids 1638-1765 of the NS4
region of hepatitis C virus-3 (HCV-3) samples from 5 blood donors and a
consensus sequence. Analysis of this and other regions of the HCV genome
revealed the existence of three distinct groups of HCV. Analysis of the
region encompassing -255 to -62 of the 5' non coding region (see AAQ43058
-75) showed a difference of 9-14% in the nucleotide sequences between the
three groups. Two of the groups identified were similar to those of HCV
variants termed type 1 and 2, whilst the third appeared to represent a
novel type of virus. Comparison of the NS3 region (see AAR37927-30)
showed a high degree of sequence diversity with type 3 being
phylogenetically different to type 1 and 2. The same degree
of differentiation was noted in the NS-5 (see AAR37923-26) and core region
between type 3 and type 1 sequences. (Updated on 25-MAR-2003 to correct
PN field.)

Identifying a candidate peptide epitope, which induces a HLA class I CTL
PT response comprises identifying variants of a peptide epitope 8-11 amino
PT acids in length comprising primary anchor residues of the same HLA class
PT I binding motif.
XX
PS Disclosure; Page 388-440; 458pp; English.
XX
The invention relates to a method of identifying a candidate peptide
CC epitope which induces an HLA class I CTL response against variants of the
CC peptide epitope, comprising identifying, from a particular antigen of an
CC infectious agent, variants of a peptide epitope comprising primary anchor
CC residues of the same HLA class I binding motif. The method is useful for
CC identifying a candidate peptide epitope, which induces an HLA class I CTL
CC response against variants of the peptide epitope. This sequence
CC represents an HCV polymerase protein used in the scope of the invention.

XX
XX Immunoassay solid support, useful for detecting hepatitis C virus
PT infection in biological sample, comprises HCV NS3/4a conformational
FT epitope and multiple epitope fusion antigen bound to the support.
XX
XX Claim 5; Fig 5; 92pp; English.
PS
XX The present invention relates to a new immunoassay solid support
CC consisting essentially of at least one hepatitis C virus (HCV) NS3/4a
CC conformational epitope and a multiple epitope fusion antigen (MEFA),
CC bound to the support. The NS3/4a conformational epitope and/or MEFA,
CC reacts specifically with anti-HCV antibodies present in a biological
CC sample from an HCV-infected individual. The immunoassay of the invention
CC is useful for detecting hepatitis C virus infection in a biological
CC sample. The method of the invention provides a sensitive, accurate
CC diagnostic and prognostic tool to provide adequate patient care and to
CC prevent transmission of HCV by blood and by blood products, or by
CC personal contact. Use of NS3/4a conformational epitope in combination
CC with MEFA, provides a sensitive and reliable method for detecting early
CC HCV seroconversion. Use of MEFA has the added advantages of decreasing
CC masking problems, improving sensitivity in detecting antibodies by
CC allowing a greater number of epitopes on a unit surface area of
CC substrate, and improving substrate. Detection accuracy is increased and
CC the incidence of false results is reduced because of the identification
CC and the use of highly immunogenic HCV antigens which are present during
CC the early stages of HCV seroconversion. The present amino acid sequence
CC represents the multiple epitope fusion antigen (MEFA) 7.1 of the
XX invention

XX
XX Immunoassay solid support for detecting Hepatitis C Virus infection in
PT biological samples, comprises Hepatitis C Virus conformational epitope
PT and multiple epitope fusion antigen.
XX
XX Claim 25; Fig 5A-5F; 45pp; English.
XX
XX The present invention relates to immunoassays comprising Hepatitis C
XX Virus (HCV) NS3/4a conformational epitope and multiple epitope fusion
XX antigen (MEFA), bound to a solid support. The NS3/4a epitope and/or the
XX multiple epitope fusion antigen react with anti-HCV antibodies present in
XX a biological sample from an HCV-infected individual. The immunoassays and
XX methods of the invention are useful for detecting HCV infection in a
XX biological sample. The inventive immunoassay solid support provides a
XX sensitive and reliable method for detecting early HCV seroconversion. The
XX assays can detect HCV infection caused by any six known genotypes of HCV.
XX The use of the multiple epitope fusion proteins decreases masking
XX problems, improves sensitivity in detecting antibodies by allowing a
XX greater number of epitopes on a unit area of substrate, and improves
XX selectivity. The present sequence represents HCV multiple epitope fusion
XX antigen 7.1 (MEFA 7.1), a mutant HCV polypeptide derived from various
XX regions of HCV type 1, 2, or 3 (HCV-1, HCV-2, or HCV-3) polypeptide

XX PT New mosaic protein, comprising a plurality of homologous antigenic

PT peptides from different genotypes of a species - useful for detecting

PT hepatitis infection in an individual.

XX Example 3; Fig 18; 66pp; English.

XX CC The invention relates to a mosaic protein, comprising a plurality of

CC homologous antigenic peptides from different genotypes of a species. The

CC antigenic peptides are from nucleocapsid (NC) proteins. A method for

CC synthesising an artificial gene that encodes the mosaic protein is also

CC provided. The method is designated restriction endonuclease assisted
CC ligation (REAL). The mosaic protein and the artificial mosaic protein are
CC useful for detecting a hepatitis infection in an individual. The mosaic
CC gene and protein is also useful for vaccination against infection,
CC especially hepatitis C. The method of synthesizing the artificial gene
CC and the resulting mosaic protein improve the sensitivity, spectrum of
CC immunoreactivity, and antigen specificity of enzyme immunoassays. This
CC provides improved detection of hepatitis C virus. The present sequence
XX represents the amino acid sequence of the NS4 mosaic protein

XX CC The sequences given in AAR37938-47 are peptides which were derived from
CC the NS-4 region of the hepatitis C virus (HCV) protein. Analysis of
CC regions of the HCV genome revealed the existence of three distinct groups
CC of HCV. Analysis of the region encompassing -255 to -62 of the 5' non
CC coding region (NCR) (see AAQ43058-75) showed a difference of 9-14% in the
CC nucleotide sequences between the three groups. Two of the groups
CC identified were similar to those of HCV variants termed type 1 and 2,
CC whilst the third appeared to represent a novel type of virus. Comparison
CC of the NS3 region (see AAR37927-30) showed a high degree of sequence
CC diversity with type 3 being phylo- genetically different to type 1 and 2.
CC The same degree of differentiation was noted in the NS-5 (see AAR37923-
CC 26), core region (see AAR37931) and the NS4 region (see AAQ43106-111)
CC between type 3 and type 1 sequences. (Updated on 25-MAR-2003 to correct

XX Improving properties of peptides for use as diagnostic antigens or for
XX preventing or treating infections.
XX
XX Claim 55; Page 73; 83pp; English.
XX
XX This is a peptide related to the immunoreactive region of the NS4 region
XX of hepatitis C virus (HCV). The peptide is useful for detecting HCV
XX infection. The invention relates to peptides derived from HCV and also
XX HIV-1 which have been modified for use as diagnostic antigens in the
XX treatment or prevention of infection. The structural stability of the
XX peptides can be increased in four different ways; through the replacement
XX of a hydrophobic amino acid with a less hydrophobic amino acid; through
XX an increase in the amount of secondary structure (i.e. alpha helix) in
XX the peptide; through the removal of a positive charge from the peptide,
XX or through the constraint of the epitopic sequence via the formation of a
XX covalent crosslink. Modified peptides of the invention are used to detect
XX infectious agents specifically HCV. Other detectable agents include HIV-1
XX Group O viruses; human T-cell lymphotropic virus-I or -II; and the
XX causative agent of syphilis. The peptides can be used for prevention or
XX treatment of infections (e.g. as vaccines, or where expressed from a
XX transgene). More generally almost any peptide can be similarly modified,
XX e.g. cytokines or interferons; major histocompatibility complex antigens;
XX hormones; growth factors; tumour markers or suppressors, or antigens from
XX many other pathogens

XX Disclosure; SEQ ID NO 1420; 645pp; English.
XX
XX The invention relates to the use of at least one set of peptides in the
XX preparation of a medicament for modulating an immune response, where
XX individual peptides of a respective set comprise different portions of an
XX amino acid sequence corresponding to a single polypeptide of interest and
XX display partial sequence identity or similarity to at least one other
XX peptide of the same set of peptides (i.e. they are overlapping). Also
XX included are an antigen-presenting cell which has been contacted with the
XX peptides above and thus presents the peptides, a population of such
XX antigen-presenting cells, a process for producing antigen-presenting
XX cells for modulating an immune response to a polypeptide of interest, a
XX method for producing antigen-specific lymphocytes, a composition
XX comprising at least one set of the peptides (and a carrier and/or
XX diluent), a method for modulating an immune response to a polypeptide of
XX interest comprising administering to a patient in need at least one set
XX of the peptides, a method for treatment and/or prophylaxis of a disease
XX or condition associated with the presence of a polypeptide of interest
XX and a composition of matter for modulating an immune response in a
XX subject to a target antigen. The polypeptide of interest is also a
XX disease- or condition-associated polypeptide that is a polypeptide
XX produced by a pathogenic organism or a cancer, and produced by a
XX pathogenic organism selected from yeast, viruses, bacteria, helminths,
XX protozoans and mycoplasmas. The disease- or condition-associated
XX polypeptide is produced by a cancer selected from melanoma, lung cancer,
XX breast cancer, cervical cancer, prostate cancer, colon cancer, pancreatic
XX cancer, stomach cancer, bladder cancer, kidney cancer, post transplant
XX lymphoproliferative disease (PTLD) or Hodgkin's lymphoma. The uncultured

CC antigen-presenting cells or their precursors are useful in the
CC preparation of a medicament for the treatment of a disease or condition
CC in a subject, which disease or condition is associated with the presence
CC or aberrant expression of a target antigen, where the antigen-presenting
CC cells or their precursors have not been subjected to activating
CC conditions but have been contacted with an antigen that corresponds to
CC the target antigen to express a processed or modified form of the antigen
CC for presentation to the subject's immune system. The present sequence is
CC one of a set of overlapping immunogenic peptides derived from a Hepatitis
CC C virus protein.

PT New synthetic polypeptides having several different segments of at least
PT one parent polypeptide linked together differently compared to the
PT linkage in the parent polypeptide, for inducing immune response against a
PT pathogen or cancer.
XX
PS Example 2; Fig 26; 364pp; English.

CC The invention relates to a new synthetic polypeptide (I) comprising
CC several different segments of at least one parent polypeptide linked
CC together in a different relationship relative to their linkage in the
CC parent polypeptide to impede, abrogate or otherwise alter at least one
CC function associated with the parent polypeptide and for inducing an
CC immune response against a pathogen or cancer. Also included are a
CC synthetic polynucleotide encoding and a computer system for designing the
CC synthetic polypeptides. The synthetic polypeptides and polynucleotides
CC are referred to as a Savine. The synthetic polypeptide is useful for
CC modulating immune responses preferably directed against a pathogen or a
CC cancer, (e.g., cancers of the lung, breast, ovary, cervix, colon, head
CC and neck, pancreas, prostate, stomach, bladder, kidney, bone liver,
CC oesophagus, brain, testicle, uterus), as potentiating agents.
CC Compositions comprising the polypeptide may be used in the treatment or
CC prophylaxis against viral (such as infections caused by HIV (human
CC immunodeficiency virus), hepatitis, influenza, Japanese encephalitis
CC virus, Epstein-Barr virus and respiratory syncytial virus), bacterial
CC (e.g., infections caused by Neisseria, Meningococcus, Haemophilus,
CC Salmonella, Streptococcus, Legionella and Mycobacterium or parasitic
CC (e.g., infections caused by Plasmodium, Schistosoma, Leishmania,
CC Trypanosoma, Toxoplasma and Giardia) infections. The present sequence is
CC a peptide derived from a parent protein used to construct a savine of the

New soluble substrates for hepatitis C virus NS3 protease - are non-
structural polyproteins and are attached to solubilising motifs, useful
for determining protease inhibitors.

Disclosure; Page 61-62; 70pp; English.

Hepatitis C virus (HCV) truncated cofactor NS4A (AAW09248), comprising
amino acids 4-54 of the native cofactor (AAW09292), is used in novel
fusions with HCV NS3 protease (see also AAW09236-40). NS4A improves the
ability of NS3 protease (see also AAW12963) to cleave HCV nonstructural
proteins. The protease-NS4A fusions can be used with substrate peptides
(AAW12957-62) in novel high throughput assays to identify HCV protease
inhibitors of potential therapeutic value

 XX New selected interacting domain polypeptides and polynucleotides, useful
 PT for treating or preventing infections or pathologies caused by hepatitis
 PT C virus (HCV) or those linked to HCV infection.
 XX
 XX Claim 26; SEQ ID NO 91; 61pp + Sequence Listing; English.
 XX
 XX The invention relates to nucleic acids encoding polypeptides which are
 CC termed SID polypeptides (selected interacting domain). These polypeptides
 CC are the final products of a double selection method involving a first
 CC step of selection of Hepatitis C virus (HCV)-derived polynucleotides
 CC through a two-hybrid system, and a second selection step involving an
 CC alignment between the different polynucleotides selected at the first
 CC step. The activity of polypeptides of the invention may be described as,
 CC virucide, hepatotropic, antiinflammatory and antibacterial. The
 CC polypeptide, polynucleotide and compositions comprising them are useful
 CC for treating or preventing viral or a bacterial infection, specifically
 CC infections or pathologies caused by HCV, or those pathologies linked to
 CC HCV infection. These may include liver disease and liver cancer. The
 CC current sequence represents a HCV bait polypeptide. Note: The sequence
 CC data for this patent is not represented in the specification, but is
 CC based on sequence information supplied by the European Patent Office

XX New inhibitors of hepatitis C protease NS3 - contain at least one of NS3 substrate sequence and NS4A co:factor polypeptide, for treatment of hepatitis C infection.

XX Disclosure; Page 37; 59pp; English.

XX This is a fragment of hepatitis C virus (HCV) NS4A polypeptide. This can be used for assaying the inhibitory activity of novel bivalent inhibitors of HCV NS3 protease. The bivalent inhibitors comprise a first peptide that is a subsequence, mutated subsequence or a mutated full-length sequence of the NS3 substrate linked to a second peptide that is a subsequence of the HCV NS4A polypeptide. These bivalent inhibitors and other monovalent inhibitors of an HCV protease comprising a subsequence, mutated subsequence or a mutated full-length sequence of the substrate of HCV NS3 protease or a subsequence, mutated subsequence or mutated full-length sequence of NS4A are used to treat HCV infection. They act by inhibiting the interaction between NS3 and at least one of its substrates and the NS4A co-factor. Compared with inhibitors that target only one component, the bivalent inhibitors may have higher binding affinity and better discrimination against similar host cell enzymes, i.e. reduced toxicity. The peptide inhibitors can be assessed for their inhibitory activity by a scintillation proximity assay using NS3, NS4 and peptide substrates 4B/5A or 5A/5B. The inhibitors are made by usual methods of solid phase synthesis and can be administered orally or by injection or by transdermal diffusion, optionally conjugated to a carrier protein

XX Bivalent and monovalent inhibitors of hepatitis C virus NS3 protease.
PS Disclosure; Col 27-28; 27pp; English.
XX The invention provides bivalent inhibitors of hepatitis C virus (HCV) NS3
CC protease. The bivalent inhibitor comprises: (a) a first peptide
CC consisting of a subsequence, a mutated subsequence or a mutated full-
CC length sequence of a substrate of the HCV NS3 protease which is not
CC cleaved by the protease; (b) a second peptide consisting of a subsequence
CC of a HCV NS4A polypeptide (sequences AAY57195-201); (c) a linker
CC comprising a chemical entity capable of forming a bond with the first
CC peptide and the second peptide and is equivalent in length to a carbon
CC chain having 7-14 carbon atoms. Monovalent inhibitors of the HCV NS3
CC protease inhibit either the interaction of a substrate or the cofactor
CC NS4A with the NS3 protease, and the bivalent inhibitor inhibits the
CC interaction of the NS3 protease with both cofactor NS4A and a substrate
CC of the NS3 protease. The mono- and bivalent inhibitors are useful for
CC treating an individual infected with the HCV. The bivalent enzyme
CC inhibitors provide a higher binding affinity (potency), as well as
CC enhanced specificity against similar cellular host enzymes for reduced
CC toxicity effects. The present sequence represents the HCV NS4A
XX protein

DE	Chloramphenicol acetyl transferase (CAT) partial sequence.

KW Hepatitis C virus; HCV; HCV NS3 protease; inhibitor; bivalent;
KW monovalent; HCV NS4A co-factor; chloramphenicol acetyl transferase
KW HCV infection; CAT.

PT New inhibitors of hepatitis C protease NS3 - contain at least one of NS3
PT substrate sequence and NS4A co:factor polypeptide, for treatment of
PT hepatitis C infection.

PS Example 3; Page 39-41; 59pp: English.

CC This is a partial sequence of the chloramphenicol acetyl transferase
CC (CAT) gene. This is used in the construction of a plasmid which produces
CC a hepatitis C virus (HCV) NS3 protease. Novel bivalent inhibitors of HCV
CC NS3 protease comprise a first peptide that is a subsequence, mutated
CC subsequence or a mutated full-length sequence of the NS3 substrate linked
CC to a second peptide that is a subsequence of the HCV NS4A polypeptide.

These bivalent inhibitors and other monovalent inhibitors of an HCV protease comprising a subsequence, mutated subsequence or a mutated full-length sequence of the substrate of HCV NS3 protease or a subsequence, mutated subsequence or mutated full-length sequence of NS4A are used to treat HCV infection. They act by inhibiting the interaction between NS3 and at least one of its substrates and the NS4A co-factor. Compared with inhibitors that target only one component, the bivalent inhibitors may have higher binding affinity and better discrimination against similar host cell enzymes, i.e. reduced toxicity. The peptide inhibitors can be assessed for their inhibitory activity by a scintillation proximity assay using NS3, NS4 and peptide substrates 4B/5A or 5A/5B. The inhibitors are

CC made by usual methods of solid phase synthesis and can be administered
 CC orally or by injection or by transdermal diffusion, optionally conjugated
 CC to a carrier protein

XX Bivalent and monovalent inhibitors of hepatitis C virus NS3 protease.

XX Example 3; Col 29-32; 27pp; English.

XX The invention provides bivalent inhibitors of hepatitis C virus (HCV) NS3
 CC protease. The bivalent inhibitor comprises: (a) a first peptide
 CC consisting of a subsequence, a mutated subsequence or a mutated full-
 CC length sequence of a substrate of the HCV NS3 protease which is not
 CC cleaved by the protease; (b) a second peptide consisting of a subsequence
 CC of a HCV NS4A polypeptide (sequences AA57195-201); (c) a linker
 CC comprising a chemical entity capable of forming a bond with the first
 CC peptide and the second peptide and is equivalent in length to a carbon
 CC chain having 7-14 carbon atoms. Monovalent inhibitors of the HCV NS3
 CC protease inhibit either the interaction of a substrate or the cofactor
 CC NS4A with the NS3 protease, and the bivalent inhibitor inhibits the
 CC interaction of the NS3 protease with both cofactor NS4A and a substrate
 CC of the NS3 protease. The mono- and bivalent inhibitors are useful for
 CC treating an individual infected with the HCV. The bivalent enzyme
 CC inhibitors provide a higher binding affinity (potency), as well as
 CC enhanced specificity against similar cellular host enzymes for reduced
 CC toxicity effects

XX New hepatitis C virus fusion proteins - comprises NS3 protease and NS4A
 PT co-factor, used in assays for screening for compounds for use in HCV
 PT therapy.

XX Claim 16; Fig 3; 31pp; English.

XX The present sequence represents a fusion protein of the invention. The
 CC fusion protein is derived from the Hepatitis C virus (HCV) NS3 protease
 CC and NS4A cofactor proteins. A non-autocleavable fusion protein of HCV NS3
 CC protease and HCV NS4A cofactor protein is produced upon expression, which
 CC is biologically active. The products can be used to obtain drugs which
 CC can inhibit NS3 protease activity for use in HCV therapy. They can also
 CC be used to design compounds which interact with or inhibit the NS3/NS4A
 CC fusion proteins

XX Identifying the presence of an antibody in a fluid sample, where the

PT antibody is immunologically reactive with a Hepatitis C virus (HCV)

PT antigen by contacting the fluid sample, which may contain a HCV antibody

PT with at a polypeptide.

XX Example 16; Col 157-160; 168pp; English.

XX The invention relates to a method for identifying the presence of an

CC antibody immunologically reactive with a Hepatitis C virus (HCV) antigen.

CC The method involves providing a fluid sample containing at least one HCV

CC antibody, contacting the fluid sample with at least one polypeptide or

CC recombinant fusion protein for complexing the antibody with the

CC polypeptide or recombinant fusion protein to provide an antibody-

CC polypeptide complex and detecting the complex. The present sequence is

CC pHCV-55 fusion protein which comprises Escherichia coli CKS (Ctp: CMP-3-

CC deoxy-manno-octuloseonate cytidyl) transferase or CMP-KDO synthase)

CC enzyme, linker and HCV (non- structural region) NS4 region. This sequence

CC is used in the invention

PT Hepatitis C assay using recombinant C-100 region antigens - for detecting

PT antibodies and antigen in body fluids from individuals exposed to

PT hepatitis C virus.

XX

XX Example 10; Page 43-45; 206pp; English.

XX A synthetic gene encoding HCV amino acids 1569-1931 was expressed at low

CC levels as a CKS fusion protein in E.coli. Deletion studies were performed

CC to identify the region(s) that were deleterious to the expression of the

CC HCV CKS-C100 antigen. Clone pHCV-19 contained codons 1569-1677 and did

CC not express the HCV CKS C100A protein. An internal deletion of 21 amino

CC

CC acids (AAs 1600-1620) was constructed using NlaIV/HaeIII and designated

CC pHCV-55 (see AAR33557). The deletion expressed well as a CKS fusion in

CC E.coli. The amino acids deleted in pHCV-55 were sequentially replaced

CC from the carboxy-terminal end using a fragment replacement method.

CC Plasmid pHCV-94 is one of the constructs produced by this process.

XX antibodies and antigen in body fluids from individuals exposed to
XX hepatitis C virus.
XX
XX Example 10; Page 51-52; 206pp; English.
XX
XX A synthetic gene encoding HCV amino acids 1569-1931 was expressed at low
XX levels as a CKS fusion protein in E.coli. Deletion studies were performed
XX to identify the region(s) that were deleterious to the expression of the
XX HCV CKS-C100 antigen. Clone pHCV-19 contained codons 1569-1677 and did
XX not express the HCV CKS C100A protein. An internal deletion of 21 amino
XX acids (AAs 1600-1620) was constructed using NlaIV/HaeIII and designated
XX pHCV-55 (see AAR33557). The deletion expressed well as a CKS fusion in
XX E.coli. The amino acids deleted in pHCV-55 were sequentially replaced
XX from the carboxy-terminal end using a fragment replacement method.
XX Plasmid pHCV-203 is one of the constructs produced by this process.

XX PT Immunoassays for Asiatic strains of hepatitis C virus - for diagnosis of
XX PT infection and screening blood supplies.
XX PS Disclosure; Fig 16A-B; 43pp; English.
XX CC The present sequence is encoded by the consensus sequence of the coding
XX CC strand of a new hepatitis C virus (HCV), J1, NS3-NS4 domain. The J1 and
XX CC J7 (also a new HCV isolate) isolates comprise sequences which are
XX CC distinct from the prototype HCV isolates, HCV1. The specification
XX CC describes immunoassays for HCV based on antigens from Asiatic strains not
XX CC cross-reactive with HCV-1. The assays are used for diagnosis of HCV
XX CC infection and to screen donated blood. The anti-HCV antibodies are also
XX CC useful therapeutically and prophylactically (passive immunisation); in
XX CC screening for antiviral agents; for isolation, purification and
XX CC identification of non-A, non-B hepatitis virus (e.g. by affinity
XX CC chromatography) and to raise anti-idiotypic antibodies (useful for
XX CC treatment or diagnosis and to determine immunogenic regions of the HCV
XX CC antigens)

XX
XX Identifying the presence of an antibody in a fluid sample, where the
PT antibody is immunologically reactive with a Hepatitis C virus (HCV)
PT antigen by contacting the fluid sample, which may contain a HCV antibody
PT with at a polypeptide.
XX
PS Example 16; Col 173-176; 168pp; English.
XX
XX The invention relates to a method for identifying the presence of an
CC antibody immunologically reactive with a Hepatitis C virus (HCV) antigen.
CC The method involves providing a fluid sample containing at least one HCV
CC antibody, contacting the fluid sample with at least one polypeptide or
CC recombinant fusion protein for complexing the antibody with the
CC polypeptide or recombinant fusion protein to provide an antibody-
CC polypeptide complex and detecting the complex. The present sequence is
CC pHCV-62 fusion protein which comprises Escherichia coli Cks (CTP: CMP-3-
CC deoxy-manno-octulosonate cytidyl transferase or CMP-KDO synthase)
CC enzyme, linker and HCV (non- structural region) NS4 region. This sequence
CC is used in the invention

XX PT Identifying the presence of an antibody in a fluid sample, where the
XX PT antibody is immunologically reactive with a Hepatitis C virus (HCV)
XX PT antigen by contacting the fluid sample, which may contain a HCV antibody
XX PT with at a polypeptide.
XX PS Example 16; Col 177-180; 168pp; English.
XX CC The invention relates to a method for identifying the presence of an
XX CC antibody immunologically reactive with a Hepatitis C virus (HCV) antigen.
XX CC The method involves providing a fluid sample containing at least one HCV
XX CC antibody, contacting the fluid sample with at least one polypeptide or
XX CC recombinant fusion protein for complexing the antibody with the
XX CC polypeptide or recombinant fusion protein to provide an antibody-
XX CC polypeptide complex and detecting the complex. The present sequence is
XX CC pHCV-63 fusion protein which comprises Escherichia coli CKS (CTP: CMP-3-
XX CC deoxy-manno-octulosonate cytidyl transferase or CMP-KDO synthase)
XX CC enzyme, linker and HCV (non- structural region) NS4 region. This sequence
XX CC is used in the invention

XX New recombinant NS5 region antigens - for hepatitis C assay for detecting
PT hepatitis C virus infections.

XX Example 8; Page 83-85; 164pp; English.

XX The clone pHCV-58 was constructed to overcome poor expression levels of
CC the HCV CKS-c100 recombinant antigen. HCV CKS-c100 antigen consists of
CC 239 amino acids of CKS, eight amino acids contributed by linker DNA
CC sequences, 363 amino acids from HCV NS4 region (amino acids 1569-1931)
CC and 10 additional amino acids contributed by linker DNA sequences. A 63bp
CC NlaIV-HaeIII fragment was deleted from pHCV-24 (a plasmid which expresses
CC the HCV CKS- c100 antigen under control of the lac promoter). The pHCV-58
CC fusion protein (containing a 21 amino acid deletion, i.e. of HCV amino
CC acids 1600-1620) was expressed at a significantly higher level than the
CC pHCV-24 fusion protein. (Updated on 25-MAR-2003 to correct PN field.)
CC (Updated on 24-OCT-2003 to standardise OS field)

XX PT Identifying the presence of an antibody in a fluid sample, where the
PT antibody is immunologically reactive with a Hepatitis C virus (HCV)
PT antigen by contacting the fluid sample, which may contain a HCV antibody
with at a polypeptide.
XX Claim 1; Col 97-102; 168pp; English.

XX The invention relates to a method for identifying the presence of an
CC antibody immunologically reactive with a Hepatitis C virus (HCV) antigen.
CC The method involves providing a fluid sample containing at least one HCV
CC antibody, contacting the fluid sample with at least one polypeptide or
CC recombinant fusion protein for complexing the antibody with the
CC polypeptide or recombinant fusion protein to provide an antibody-
CC polypeptide complex and detecting the complex. The present sequence is
CC pHCV-58 fusion protein which comprises Escherichia coli CKS (CTP: CMP-3-
CC deoxy-manno-octulosonate cytidyl transferase or CMP-KDO synthase)
CC enzyme, linker and HCV (non- structural region) NS4 region. This sequence
CC is used in the invention

 XX
 PS Disclosure; Fig 1a-c; 31pp; English.
 XX
 CC The present sequence is encoded by the partial nucleotide sequence of a
 CC Hepatitis C virus (HCV) genome, strain H. The specification describes a
 CC construct which encodes HCV NS3 protease and NS4A cofactor protein. A non
 CC -autocleavable fusion protein of HCV NS3 protease and HCV NS4A cofactor
 CC protein is produced upon expression, which is biologically active. The
 CC product can be used to obtain drugs which can inhibit NS3 protease
 CC activity for use in HCV therapy. They can also be used to design
 CC compounds which interact with or inhibit the NS3/NS4A fusion proteins

 XX Mutant non-structural (NS) Hepatitis C virus (HCV) polypeptide, useful as
 PT a vaccine against HCV, comprises a polypeptide having a mutation that
 PT functionally disrupts the catalytic domain of NS3.
 XX
 PS Disclosure; Fig 9; 340pp; English.
 XX
 CC The invention relates to an isolated mutant non-structural (NS) Hepatitis
 CC C virus (HCV) polypeptide, comprising a polypeptide having a mutation in
 CC the catalytic domain of NS3, where the mutation functionally disrupts the

CC catalytic domain. The NS mutant polypeptides can include NS3, NS4 (NS4a
CC and NS4b) NS5 (NS5a and NS5b) or portions thereof. The HCV polypeptide
CC and polynucleotide (preferably DNA or a plasmid) compositions can be used
CC in vaccines against HCV and as diagnostics. The antibodies raised against
CC these polypeptides can also be used as diagnostics, or for passive
CC immunotherapy. The antibodies are also useful for isolating and
CC identifying HCV particles. The present sequence represents the amino acid
CC sequence of a NS3/4A polypeptide from the plasmid pCMV-NS3/4A

XX Immunoassay solid support, useful for detecting hepatitis C virus
PT infection in biological sample, comprises HCV NS3/4a conformational
PT epitope and multiple epitope fusion antigen bound to the support.

XX Claim 5; Fig 3; 92pp; English.

XX The present invention relates to a new immunoassay solid support
CC consisting essentially of at least one hepatitis C virus (HCV) NS3/4a
CC conformational epitope and a multiple epitope fusion antigen (MEFA),
CC bound to the support. The NS3/4a conformational epitope and/or MEFA,
CC reacts specifically with anti-HCV antibodies present in a biological
CC sample from an HCV-infected individual. The immunoassay of the invention

CC is useful for detecting hepatitis C virus infection in a biological
CC sample. The method of the invention provides a sensitive, accurate
CC diagnostic and prognostic tool to provide adequate patient care and to
CC prevent transmission of HCV by blood and by blood products, or by
CC personal contact. Use of NS3/4a conformational epitope in combination
CC with MEFA, provides a sensitive and reliable method for detecting early
CC HCV seroconversion. Use of MEFA has the added advantages of decreasing
CC masking problems, improving sensitivity in detecting antibodies by
CC allowing a greater number of epitopes on a unit surface area of
CC substrate, and improving substrate. Detection accuracy is increased and
CC the incidence of false results is reduced because of the identification
CC and the use of highly immunogenic HCV antigens which are present during
CC the early stages of HCV seroconversion. The present amino acid sequence
CC represents the non-structural protein NS3/4a conformational epitope of
XX the invention

XX Immunoassay solid support useful for detecting hepatitis C virus
PT infection in a biological sample, comprises at least one of HCV anti-core
PT antibody and HCV NS3/4a epitope, bound to the support.

XX Example 2; Fig 4; 87pp; English.

XX The present invention relates to hepatitis C virus (HCV) core antigen and

CC NS (nonstructural) 3/4a antibody combination assay that can detect both
CC HCV antigens and antibodies present in a sample using a single solid
CC matrix as well as immunoassay solid supports for use in the assay. The
CC solid support is useful for detecting HCV infection in a biological
CC sample. The present sequence is HCV-1 NS3/4a mutant conformational
CC antigen. This sequence is used in the exemplification of the invention

PS The invention relates to a composition comprising ribavirin and an
antigen preferably non structural 3 protein (NS3)/4A fragment of
hepatitis C virus (HCV) genome or a peptide or nucleic acid of HCV
sequence. The composition is useful for enhancing an immune response to a
hepatitis C antigen in humans, domestic, sport or pet species and as
vaccines for treating and preventing HCV infections. The composition is
also useful for treating viral, bacterial, fungal diseases and cancer.
The present sequence is HCV NS3/4A mutant protein

XX hepatitis C virus infection, comprises ribavirin and antigen that has
XX epitope present in hepatitis C virus.
XX
XX Example 6; Page 113-114; 120pp; English.
XX
XX The invention relates to a composition comprising ribavirin and an
XX antigen preferably non structural 3 protein (NS3)/4A fragment of
XX hepatitis C virus (HCV) genome or a peptide or nucleic acid of HCV
XX sequence. The composition is useful for enhancing an immune response to a
XX hepatitis C antigen in humans, domestic, sport or pet species and as
XX vaccines for treating and preventing HCV infections. The composition is
XX also useful for treating viral, bacterial, fungal diseases and cancer.
XX The present sequence is HCV NS3/4A mutant protein

XX Detecting hepatitis C virus (HCV) infection in a biological sample by
PT detecting complexes formed between the HCV antibody and the antigens from
PT the first region of the HCV polyprotein and the multiple epitope fusion
PT antigen (MEPA).
XX Claim 5; SEQ ID NO 2; 93pp; English.
XX The invention relates to a method of detecting hepatitis C virus (HCV)
CC

CC infection in a biological sample. The method comprises providing an
CC immunoassay solid support comprising HCV antigens bound to it, where the
CC HCV antigens comprise one or more isolated antigens form a first region
CC of the HCV polyprotein, combining a biological sample with the solid
CC support under conditions that allow HCV antibodies, when present in the
CC biological sample, to bind to the one or more HCV antigens, adding to the
CC solid support a detectably labelled HCV multiple epitope fusion antigen
CC (MEPA), where the labelled MEPA comprises at least one epitope from the
CC same region of the HCV polyprotein as the one or more isolated antigens,
CC where the MEPA binds to the bound HCV antibody, and detecting complexes
CC formed between the HCV antibody and the one or more antigens from the
CC first region of the HCV polyprotein and the MEPA, if any, as an
CC indication of HCV infection in the biological sample. The method is
CC useful for detecting hepatitis C virus (HCV) infection in a biological
CC sample. This sequence represents the NS3/4a conformational epitope used
CC in the scope of the invention.

XX Immunoassay solid support useful for detecting hepatitis C virus
PT infection in a biological sample, comprises at least one of HCV anti-core
PT antibody and HCV NS3/4a epitope, bound to the support.
XX Disclosure; Fig 3; 87pp; English.
XX The present invention relates to hepatitis C virus (HCV) core antigen and
CC NS (nonstructural) 3/4a antibody combination assay that can detect both
CC HCV antigens and antibodies present in a sample using a single solid
CC matrix as well as immunoassay solid supports for use in the assay. The

CC solid support is useful for detecting HCV infection in a biological
CC sample. The present sequence is NS3/4a mutant conformational antigen.
CC This sequence is used in the exemplification of the invention

XX Immunoassay solid support for detecting hepatitis C virus infection in

XX biological samples, comprises a hepatitis C virus anti-core antibody and
XX an isolated hepatitis C virus NS3/4a epitope bound HCV anti-core
XX antibody.
XX Example 1; Fig 3; 40pp; English.
XX The invention relates to a novel immunoassay solid support comprising at
XX least one hepatitis C virus (HCV) anti-core antibody and at least one
XX isolated HCV NS3/4a (non-structural protein 3/4a) epitope bound thereto.
XX The system of the invention may be useful for detecting HCV infection in
XX a biological sample and for treating or detecting non-A, non-B hepatitis
XX (NANB hepatitis). The current sequence is that of the HCV mutant
XX conformational NS3/4a epitope protein of the invention which contains an
XX S182A mutation.

 XX Identifying the presence of an antibody in a fluid sample, where the
 PT antibody is immunologically reactive with a Hepatitis C virus (HCV)
 PT antigen by contacting the fluid sample, which may contain a HCV antibody
 PT with at a polypeptide.
 XX
 XX Example 17; Col 187-192; 168pp; English.
 PS
 XX The invention relates to a method for identifying the presence of an
 CC antibody immunologically reactive with a Hepatitis C virus (HCV) antigen.
 CC The method involves providing a fluid sample containing at least one HCV
 CC antibody, contacting the fluid sample with at least one polypeptide or
 CC recombinant fusion protein for complexing the antibody with the
 CC polypeptide or recombinant fusion protein to provide an antibody-
 CC polypeptide complex and detecting the complex. The present sequence is
 CC pHCV-72 fusion protein which comprises Escherichia coli CKS (CTP: CMP-3-
 CC deoxy-manno-octulosonate cytidyl transferase or CMP-KDO synthase)
 CC enzyme, linker and HCV (non- structural region) NS region. This sequence
 CC is used in the invention

New recombinant antigens representing distinct antigenic regions of
Hepatitis C virus (HCV) genome, useful for detection of antibodies and
antigens in body fluids of individuals exposed to HCV.
Claim 3; Col 197-202; 167pp; English.
The present invention describes recombinant Hepatitis C virus (HCV)
antigens (I). (I) is useful as a reagent for the detection of antibodies
and antigen in body fluids from individuals exposed to HCV. The HCV assay
uses reliable and efficient reagents and methods to accurately detect the
presence of HCV infection. Antigenic regions in samples obtained from suspected
of having HCV infection. AAF32218 to AAF32235, AAB51371 to AAB51379 and
AAB69001 to AAB69032 represent sequences used in the exemplification of
the present invention

XX
XX Combination of three hepatitis C virus antigens - used for detection of
XX specific antibodies to diagnose infection.
XX
XX Example 6; Col 59-68; 57pp; English.
XX
XX This sequence represents a Hepatitis c virus (HCV) antigen combination of
XX the invention. The HCV antigen combination comprises an antigen (Agi)
XX comprising the C domain (i.e. amino acids (aa) 1-120 of the HCV
XX polyprotein), or its immunologically reactive fragment containing at
XX least 8 aa. It also comprises two additional antigens from two different
XX polypeptide domains, including at least 8 aa from the NS3, NS4, S or NS5
XX domains of the polyprotein, corresponding, respectively, to aa 1050-1640;
XX 1640-2000; 120-400 and 2000-3011 of the HCV polyprotein. Alternatively,
XX Ag1 contains at least 8 aa from the 1-122 or 9-177 aa regions of the HCV
XX polyprotein. These antigen combinations are used diagnostically to detect
XX anti-HCV antibodies, using any standard immunoassay format. These antigen
XX combinations have a broader range of reactivity with antibodies than any
XX antigen individually. (Updated on 25-MAR-2003 to correct PR field.)

PT Combination of hepatitis C viral (HCV) antigens, useful in improved
PT immunoassay for detecting HCV antibodies.
XX
PS Example 6; Fig 4; 58pp; English.
XX
CC The invention relates to combination of hepatitis C viral (HCV) antigens
CC that have a broader range of immunological reactivity than any single HCV
CC antigen. The combinations consist of an antigen from the C domain of the
CC HCV polyprotein, and at least one additional HCV antigen from either the
CC NS3 domain, the NS4 domain, the S domain, or the NS5 domain and are in
CC the form of fusion protein, a simple physical mixture, or the individual
CC antigens commonly bound to a solid matrix. The combinations of antigens
CC provides broad range immunoassays for anti-HCV antibodies. The invention
CC therefore provides a method for detecting antibodies to HCV in a mammal
CC suspected of containing such antibodies. The present sequence is a
CC protein encoded by PSOD/c200/core expression plasmid DNA containing HCV
CC coding sequence

XX New non-human mammal whose liver comprises a gene system comprising a promoter, and a DNA encoding a protease, a reporter, or protein whose expression causes liver damage, useful as a model for protease activity and for liver damage.

XX Disclosure; Fig 4; 95pp; English.

XX The invention relates to a non-transgenic, non-human animal useful as a model for protease activity and for liver damage, including steatosis and related disorders. A claimed non-human mammal has a liver comprising: (A) a promoter; (B) DNA encoding a protease; and (C) DNA encoding a reporter, where A, B and C are operably linked, and where the presence of reporter activity is indicative of protease activity. The reporter is secreted alkaline phosphatase (SEAP), luciferase, chloramphenicol acetyltransferase, luciferase, beta-galactosidase, green fluorescent protein or horseradish peroxidase, and is detectable in the blood, tissue or serum of the mammal. In another embodiment, the liver of the mammal comprises a gene system comprising an operably linked promoter and DNA encoding a protein whose expression causes liver damage, especially a protease, kinase or esterase. The protease is especially a viral protease such as hepatitis C virus (HCV) NS3.4A protease. The mammal is preferably a mouse, rat or chimpanzee. Methods of producing the mammalian model are claimed. Also claimed are: a hepatocyte or hepatocyte cell line comprising the gene system; methods for identifying compounds that modulate steatosis or which can be used to treat non-alcoholic fatty liver disease (NAFLD), nonalcoholic steatohepatitis (NASH), alcohol steatosis or Reye's syndrome; a method for hepatoprotection in a mammal comprising administering a HCV NS3.4A protease inhibitor; and methods of treating steatosis or fatty liver, alcoholic steatosis, NAFLD, NASH or Reye's syndrome in a mammal by administering a HCV NS3.4A protease inhibitor. The present sequence is that of a fusion protein comprising a HCV protease fused to SEAP via the 4AB junction of HCV.

XX New non-human mammal whose liver comprises a gene system comprising a promoter, and a DNA encoding a protease, a reporter, or protein whose expression causes liver damage, useful as a model for protease activity and for liver damage.

XX Disclosure; Fig 2; 95pp; English.

XX The invention relates to a non-transgenic, non-human animal useful as a model for protease activity and for liver damage, including steatosis and related disorders. A claimed non-human mammal has a liver comprising: (A) a promoter; (B) DNA encoding a protease; and (C) DNA encoding a reporter, where A, B and C are operably linked, and where the presence of reporter activity is indicative of protease activity. The reporter is secreted alkaline phosphatase (SEAP), luciferase, chloramphenicol acetyltransferase, luciferase, beta-galactosidase, green fluorescent protein or horseradish peroxidase, and is detectable in the blood, tissue or serum of the mammal. In another embodiment, the liver of the mammal comprises a gene system comprising an operably linked promoter and DNA encoding a protein whose expression causes liver damage, especially a

CC protease, kinase or esterase. The protease is especially a viral protease
 CC such as hepatitis C virus (HCV) NS3.4A protease. The mammal is preferably
 CC a mouse, rat or chimpanzee. Methods of producing the mammalian model are
 CC claimed. Also claimed are: a hepatocyte or hepatocyte cell line
 CC comprising the gene system; methods for identifying compounds that
 CC modulate steatosis or which can be used to treat non-alcoholic fatty
 CC liver disease (NAFLD), nonalcoholic steatohepatitis (NASH), alcohol
 CC steatosis or Reye's syndrome; a method for hepatoprotection in a mammal
 CC comprising administering a HCV NS3.4A protease inhibitor; and methods of
 CC treating steatosis or fatty liver, alcoholic steatosis, NAFLD, NASH or
 CC Reye's syndrome in a mammal by administering a HCV NS3.4A protease
 CC inhibitor. The present sequence is that of a fusion protein comprising a
 CC mutant HCV protease fused to SEAP via the 4AB junction of HCV. The Ser-
 CC 139 of NS3 protein in the protease active site is mutated to Ala to
 CC render the protease inactive.

XX New hepatitis C virus (HCV) fusion proteins with modified NS3 domains,
PT useful for manufacturing a medicament for stimulating a cellular immune
PT response, particularly for preventing or treating HCV infection, in
PT mammals.
XX
XX Disclosure; SEQ ID NO 6; 86pp; English.
PS
XX The invention relates to an immunogenic fusion protein comprising a
CC modified NS3 polypeptide containing an amino acid substitution to the

CC hepatitis C virus (HCV) NS3 region, so that protease activity is
 CC inhibited, and a polypeptide derived from a region of the HCV polyprotein
 CC other than the NS3 region. The modification comprises a substitution of
 CC an amino acid corresponding to His-1083, Asp-1105 and/or Ser-1165,
 CC numbered relative to the full-length HCV-1 polyprotein. The immunogenic
 CC fusion protein or the modified NS3 polypeptide are useful in
 CC manufacturing a medicament or a composition for stimulating a cellular
 CC immune response in a vertebrate subject (claimed). These may be used in
 CC identifying epitopes of HCV polypeptides associated with a strong
 CC cytotoxic T-lymphocyte (CTL) response, or in preventing or treating HCV
 CC infection in mammals, including humans. The present sequence represents a
 CC representative HCV modified fusion protein, with the NS3 protease domain
 CC deleted from the N-terminus and including the 1-121 of Core on the C-
 CC terminus.

XX New fusion protein comprises hepatitis C virus (HCV) polypeptides, which
 PT consist of an NS3, an NS4, an NS4 and a core polypeptide of HCV, useful
 PT for stimulating immune response, e.g. activating T cells of a vertebrate.

PS Claim 6; SEQ ID NO 8; 136pp; English.

XX The present invention describes a fusion protein comprising hepatitis C
 CC virus (HCV) polypeptides, where the HCV polypeptides consist of an NS3,
 CC an NS4, an NS5 and a core polypeptide of HCV, and the core polypeptide
 CC consist of amino acids 1-121 of the HCV polyprotein, numbered relative to
 CC the full-length HCV-1 polyprotein. Also described: (1) an isolated and
 CC purified polynucleotide that encodes the fusion protein; (2) a
 CC composition comprising the fusion protein or the isolated and purified
 CC polynucleotide and a pharmaceutical excipient; and (3) activating T cells
 CC of a vertebrate subject which recognise an epitope of an HCV polypeptide.

CC The fusion protein has antiviral activity, and can be used in vaccines.
 CC The composition is useful for activating T cells of a vertebrate subject
 CC which recognise an epitope of an of the NS3, NS4, NS5 and/or core
 CC polypeptides. It is also useful for the manufacturing of a medicament for
 CC activating T cells. The present sequence represents an HCV NS345Core
 CC fusion protein amino acid sequence, which is used in the exemplification
 CC of the present invention.

XX Mutant non-structural (NS) Hepatitis C virus (HCV) polypeptide, useful as
 PT a vaccine against HCV, comprises a polypeptide having a mutation that
 PT functionally disrupts the catalytic domain of NS3.

PS Example 1; Fig 21; 340pp; English.

XX The invention relates to an isolated mutant non-structural (NS) Hepatitis
 CC C virus (HCV) polypeptide, comprising a polypeptide having a mutation in
 CC the catalytic domain of NS3, where the mutation functionally disrupts the
 CC catalytic domain. The NS mutant polypeptides can include NS3, NS4 (NS4a
 CC and NS4b) NS5 (NS5a and NS5b) or portions thereof. The HCV polypeptide
 CC and polynucleotide (preferably DNA or a plasmid) compositions can be used
 CC in vaccines against HCV and as diagnostics. The antibodies raised against
 CC these polypeptides can also be used as diagnostics, or for passive
 CC immunotherapy. The antibodies are also useful for isolating and
 CC identifying HCV particles. The present sequence represents the amino acid
 CC sequence of the pd.deltans3NS5.pj.core140

 XX Novel composition comprising a hepatitis C virus antisense polynucleotide
 XX which is complementary to or corresponds to a sense strand of the virus
 XX genome, and selectively hybridizes to it.
 XX Example; Fig 16; 75pp; English.
 XX The specification describes a pharmaceutical composition which comprises
 XX a hepatitis C virus (HCV) antisense polynucleotide. The HCV is
 XX characterized by a positive stranded RNA genome which has 40% homology at
 XX the polypeptide level to a HCV polypeptide. The antisense polynucleotide
 XX binds to cellular polynucleotides which enhance and/or are required for
 XX viral infectivity, replicative ability or chronicity. The antisense
 XX polynucleotides may also be designed to bind with high specificity, to be
 XX of increased stability, to be stable and to have low toxicity. The
 XX composition also comprises an agent which causes viral RNA to be
 XX inactive. The composition is used for preventing HCV replication in a
 XX system. The present sequence is encoded by a novel HCV cDNA sequence,
 XX which is used in the course of the invention

XX New synthetic peptides for detecting antibodies to hepatitis C virus -
 useful in e.g. ELISA assays, and for detection of HCV antigens or as
 immunogens.

XX Disclosure; Fig 1; 32pp; English.

CC RNA viruses frequently exhibit a high rate of spontaneous mutation, thus
CC a virus is considered to be the same of equiv. to HCV if it exhibits a
CC global homology of more than 70 percent with the HCV HC- J1/CDC/CHI
CC composite sequence. The peptide fragments of this DNA sequence indicated
CC in the features table can immunologically mimic proteins encoded by HCV.
CC Additional amino acids or chemical gps. may be added to either end of the
CC peptides for the purpose of creating a linker arm for attachment to a
CC carrier. The peptides can be used for the detection of antibodies
CC specific for HCV. They may be used in the form of kits, opt. with
CC reagents such as staphylococcal protein A, streptococcal protein G,
CC avidin or streptavidin. The peptides may also be used as immunogens for
CC raising antibodies. (Updated on 25-MAR-2003 to correct PN field.)

XX
CC The present sequence is Hepatitis C virus (HCV) H77C protein from
CC chimpanzee #96A008 which lacks the hypervariable region one (HVR1) of HCV
CC envelope 2 (E2). The HCV E2 protein lacking HVR1 (H77C(HVR1)) DNA is
CC useful for producing infectious HCV and chimeric HCV viruses which are
CC are useful for identifying cell lines capable of supporting the
CC replication of viruses. The infectious HCV and HVR1- chimeric HCV are
CC used in the production of attenuated or inactivated vaccines which are
CC useful for treating or preventing HCV in a mammal by immunisation. The
CC host cells expressing the H77C(HVR1)DNA is useful as an immunogen to
CC stimulate a protective immune response to HCV. The immunogens are useful
CC for producing protective antibodies to HCV. The antibodies produced are

CC used in passive immunoprophylaxis for treatment of diseases caused by HCV
 CC in animals, especially humans. The H77C(HVR1) DNA is also useful in gene
 CC therapy. Note: The present sequence is not found in the specification but
 CC is derived from Hepatitis C virus envelope protein 2 lacking
 CC hypervariable region 1 (AAE00442) referred as SEQ ID NO: 2 and shown in
 CC figure 1

XX

CC The present sequence is Hepatitis C virus (HCV) H77C protein from
 CC chimpanzee 1590 which lacks the hypervariable region one (HVR1) of HCV
 CC envelope 2 (E2). The HCV E2 protein lacking HVR1 (H77C(HVR1)) DNA is
 CC useful for producing infectious HCV and chimeric HCV viruses which are
 CC are useful for identifying cell lines capable of supporting the
 CC replication of viruses. The infectious HCV and HVR1- chimeric HCV are
 CC used in the production of attenuated or inactivated vaccines which are
 CC useful for treating or preventing HCV in a mammal by immunisation. The
 CC host cells expressing the H77C(HVR1)DNA is useful as an immunogen to
 CC stimulate a protective immune response to HCV. The immunogens are useful
 CC for producing protective antibodies to HCV. The antibodies produced are
 CC used in passive immunoprophylaxis for treatment of diseases caused by HCV
 CC in animals, especially humans. The H77C(HVR1) DNA is also useful in gene
 CC therapy. Note: The present sequence is not found in the specification but
 CC is derived from Hepatitis C virus envelope protein 2 lacking
 CC hypervariable region 1 (AAE00442) referred as SEQ ID NO: 2 and shown in
 CC figure 1

 PT protein lacking all or part of hypervariable region 1 of envelope
 PT protein, useful as vaccine components for treating or preventing HCV
 PT infections.

XX Claim 1; Fig 1G-H; 80pp; English.

XX

XX The present sequence is infectious hepatitis C virus (HCV) of genotype 1a
CC clone [H7C(HVR1)] which lacks the hypervariable region one (HVR1) of HCV
CC envelope 2 [82]. The HCV E2 protein lacking HVR1 DNA is useful for
CC producing infectious HCV and chimeric HCV viruses which are useful
CC for identifying cell lines capable of supporting the replication of
CC viruses. The infectious HCV and HVR1-chimeric HCV are used in the
CC production of attenuated or inactivated vaccines which are useful for
CC treating or preventing HCV in a mammal by immunisation. The host cells
CC expressing the H7C(HVR1) DNA is useful as an immunogen to stimulate a
CC protective immune response to HCV. The immunogens are useful for
CC producing protective antibodies to HCV. The antibodies produced are used
CC in passive immunoprophylaxis for treatment of diseases caused by HCV in
CC animals, especially humans. The H7C(HVR1) DNA is also useful in gene
CC therapy

XX Inhibiting hepatitis C virus infection of susceptible cell or target cell
XX comprises contacting cell with compound to inhibit binding of hepatitis C
XX virus envelope glycoprotein to specified intracellular adhesion proteins.
XX
XX Claim 100; SEQ ID NO 3; 47pp; English.

XX The invention relates to a method for inhibiting Hepatitis C virus (HCV)
CC infection using dendritic cell-specific intracellular adhesion molecule 3
CC -grabbing noninegrin (DC-SIGN) or DC-SIGN related (DC-SIGNR) protein.
CC The method is useful for inhibiting HCV infection of a susceptible cell
CC or a target cell, e.g. a primary cell, a dendritic cell, endometrial cell
CC in liver or placenta cell. It is useful for diagnosing and treating HCV
CC infection. The method is useful for treating or preventing a liver

CC disease, e.g., hepatitis, cirrhosis and hepatocellular carcinoma. The
CC present sequence is HCV polyprotein. This sequence is used to illustrate
CC the method of the invention.

XX FT Combination of three hepatitis C virus antigens - used for detection of
FT specific antibodies to diagnose infection.
XX PS Disclosure; Col 25-46; 57pp; English.
XX CC This sequence represents the Hepatitis C virus polyprotein. Fragments of
CC the DNA encoding this sequence can be amplified and used in the
CC combination of HCV antigens of the invention. The HCV antigen combination
CC comprises an antigen (Ag1) comprising the C domain (i.e. amino acids (aa)
CC 1-120 of the HCV polyprotein), or its immunologically reactive fragment
CC containing at least 8 aa. It also comprises two additional antigens from
CC two different polyprotein domains, including at least 8 aa from the NS3,
CC NS4, S or NS5 domains of the polyprotein, corresponding, respectively, to
CC aa 1050-1640; 1640-2000; 120-400 and 2000-3011 of the HCV polyprotein.
CC Alternatively, Ag1 contains at least 8 aa from the 1-122 or 9-177 aa
CC regions of the HCV polyprotein. These antigen combinations are used
CC diagnostically to detect anti-HCV antibodies, using any standard
CC immunoassay format. These antigen combinations have a broader range of
CC reactivity with antibodies than any antigen individually. (Updated on 25-
CC MAR-2003 to correct PR field.)

PT conserved sequence, an open reading frame encoding functional components
PT and a 3'-terminal conserved sequence.
XX PS Disclosure; Page 104-115; 209pp; English.
XX CC This is the amino acid sequence of the polyprotein encoded by hepatitis C
CC virus (HCV) isolate H77 (see AAV59361). Its cleavage products form
CC functional components of HCV virus particles and RNA replication
CC machinery. A genetically engineered HCV nucleic acid clone is claimed
CC that comprises at least a functional portion of the HCV H77 nucleic
CC acid sequence. The invention relates to the determination of functional
CC HCV genomic RNA sequences, to construction of infectious HCV DNA clones,
CC and to the use of the clones, or their derivatives, in therapeutic,
CC vaccine and diagnostic applications. The invention is also directed to
CC HCV vectors, e.g. for gene therapy or gene vaccines. The products and
CC methods can also be used for identifying cell lines or animals that are
CC permissive for infection with HCV, for studying HCV infection, isolating
CC functional components of HCV, and for screening for agents capable of
CC modulating HCV replication in vitro and in vivo. (Updated on 17-OCT-2003

XX CC This is the amino acid sequence of the polyprotein encoded by hepatitis C
CC virus (HCV) isolate H-CMR (see AAV59378). Its cleavage products form
CC functional components of HCV virus particles and RNA replication
CC machinery. A genetically engineered HCV nucleic acid clone is claimed
CC that comprises at least a functional portion of an HCV nucleic acid
CC sequence. The invention relates to the determination of functional HCV
CC genomic RNA sequences, to construction of infectious HCV DNA clones, and
CC to the use of the clones, or their derivatives, in therapeutic, vaccine
CC and diagnostic applications. The invention is also directed to HCV
CC vectors, e.g. for gene therapy or gene vaccines. The products and methods
CC can also be used for identifying cell lines or animals that are
CC permissive for infection with HCV, for studying HCV infection, isolating

XX Immunocassays for hepatitis C virus antibodies - using combinations of
PT antigenic fragments of HCV polyprotein.
XX
XX Disclosure; Fig 1; 59pp; English.
XX
CC This sequence represents the hepatitis C virus (HCV) polyprotein which is
CC used in the construction of novel combinations of HCV antigens that have
CC a broader range of immunological activity than any single HCV antigen. An
CC example of such an antigen given in this specification comprises a first
CC antigen containing at least 8 amino acids of the C domain of the HCV
CC polyprotein and a second antigen comprising at least 8 amino acids of the
CC NS3 domain, the NS4 domain, the S domain or the NS5 domain of the HCV
CC polyprotein in the form of a fusion protein, a physical mixture or bound
CC to a solid matrix. Note: The features given in the specification as
CC represented in the feature table of AAW40038 differ from the positions
CC indicated in Figure 1

XX New isolated hepatitis C virus nucleic acids - used to develop products
XX for the diagnosis, prevention and treatment of HCV infections and for
XX developing screening assays.
XX
XX Claim 7; Fig 16G-H; 126pp; English.
XX
XX This polypeptide is encoded by the genome (see AAX24833) of infectious
XX hepatitis C virus (HCV) chimeric 1a/1b clone pH77C-J4. It comprises the
XX nonstructural region of infectious genotype 1a strain H77 (see AAW98020)
XX and the structural region of infectious genotype 1b strain HC-J4 (see
XX AAW98021). The construction of such chimeric nucleic acid sequences is

CC expected to be of importance in studying the growth and virulence
 CC properties of HCV and in the production of HCV suitable for conferring
 CC protection against multiple genotypes of HCV. The invention also relates
 CC to the introduction of mutations or deletions into infectious nucleic
 CC acid sequences in order to produce an attenuated HCV virus suitable for
 CC vaccine development. Infectious nucleic acid sequences can also be used
 CC to produce attenuated virus via passage in vitro or in vivo of the
 CC viruses produced by transfection of a host cell with the infectious
 CC nucleic acid sequence. Vaccines comprising one or more polypeptides made
 CC from the infectious nucleic acid sequence are used to immunise mammals,
 CC especially humans, against hepatitis C. The nucleic acid sequences can
 CC also be used to induce protective immunity against the virus. The nucleic
 CC acid sequences or their encoded proteases (e.g. NS3 protease) can
 CC additionally be used to develop screening assays to identify antiviral
 CC agents for HCV

 XX
 XX New isolated hepatitis C virus nucleic acids - used to develop products
 PT for the diagnosis, prevention and treatment of HCV infections and for
 PT developing screening assays.
 XX
 XX Claim 4; Fig 4G-H; 126pp; English.
 XX
 XX This protein is encoded by the infectious hepatitis C virus (HCV)
 CC genotype 1a strain H77 genome (see AAX24832). H77 was obtained from a
 CC patient in the acute phase of transfusion-associated non-A, non-B
 CC hepatitis. The infectious nucleic acid sequence can be used to produce
 CC chimeric genomes (see AAX24833) consisting of the open reading frames of
 CC infectious nucleic acid sequences of other genotypes (including genotypes
 CC 1-6) and subtypes (such as 1b, 2a, 2b, 2c, 3a, 4a-f, 5a and 6a) of HCV.
 CC The invention also relates to the introduction of mutations or deletions
 CC into infectious nucleic acid sequences in order to produce an attenuated

CC HCV virus suitable for vaccine development. Infectious nucleic acid
 CC sequences can also be used to produce attenuated virus via passage in
 CC vitro or in vivo of the viruses produced by transfection of a host cell
 CC with the infectious nucleic acid sequence. Vaccines comprising one or
 CC more polypeptides made from the infectious nucleic acid sequence are used
 CC to immunise mammals, especially humans, against hepatitis C. The nucleic
 CC acid sequences can also be used to induce protective immunity against the
 CC virus. The nucleic acid sequences or their encoded proteases (e.g. NS3
 CC protease) can additionally be used to develop screening assays to
 CC identify antiviral agents for HCV

XX New nucleic acid comprising a chimeric bovine viral diarrhoea virus genome
XX PT in which the (non-)structural region has been replaced by hepatitis C
XX FT virus (HCV) genome useful for treating or preventing HCV signs and
XX PT symptoms.
XX XX
XX Disclosure; Fig 3G-H; 97pp; English.
XX PS
XX The specification describes a nucleic acid comprising a chimeric virus
XX CC genome, specifically bovine viral diarrhoea virus (BVDV) genome in which
XX CC the (non-)structural region has been replaced by the (non-)structural
XX CC region of a hepatitis C virus (HCV) genome. The nucleic acids comprising
XX CC the chimeric virus and the chimeric virus are useful for identifying cell
XX CC lines capable of supporting the replication of these chimeric viruses, in
XX CC screening for neutralizing antibodies to HCV of different genotypes, in
XX CC the production of HCV-BVDV virions, for the development of inactivated or
XX CC attenuated vaccines to prevent HCV-BVDV in a mammal, in studying the
XX CC molecular properties of HCV indirectly in vitro, and in identifying
XX CC inhibitors of viral enzyme activity which would be useful as antiviral
XX CC agents. Formulations or compositions comprising the chimeric viruses may
XX CC be used to treat or prevent the signs and symptoms of HCV. The present
XX CC sequence is encoded by a HCV clone, which is used to construct chimeric
XX CC nucleic acids of the invention

XX
XX
XX New synthetic polypeptides having several different segments of at least
XX one parent polypeptide linked together differently compared to the
XX linkage in the parent polypeptide, for inducing immune response against a
XX pathogen or cancer.
XX
XX Example 2; Fig 26; 364pp; English.
XX
XX The invention relates to a new synthetic polypeptide (I) comprising
XX several different segments of at least one parent polypeptide linked
XX together in a different relationship relative to their linkage in the
XX parent polypeptide to impede, abrogate or otherwise alter at least one
XX function associated with the parent polypeptide and for inducing an
XX immune response against a pathogen or cancer. Also included are a
XX synthetic polynucleotide encoding and a computer system for designing the
XX synthetic polypeptides. The synthetic polypeptides and polynucleotides
XX are referred to as a Savine. The synthetic polypeptide is useful for
XX modulating immune responses preferably directed against a pathogen or a
XX cancer, (e.g., cancers of the lung, breast, ovary, cervix, colon, head
XX and neck, pancreas, prostate, stomach, bladder, kidney, bone liver,
XX esophagus, brain, testicle, uterus), as potentiating agents.
XX Compositions comprising the polypeptide may be used in the treatment or
XX prophylaxis against viral (such as infections caused by HIV (human
XX immunodeficiency virus), hepatitis, influenza, Japanese encephalitis
XX virus, Epstein-Barr virus and respiratory syncytial virus), bacterial
XX (e.g., infections caused by Neisseria, Meningococcal, Haemophilus,
XX Salmonella, Streptococcal, Legionella and Mycobacterium or parasitic
XX (e.g., infections caused by Plasmodium, Schistosoma, Leishmania,
XX Trypanosoma, Toxoplasma and Giardia) infections. The present sequence is
XX a consensus sequence for a parent protein used to design a savine of the
XX invention

XX
XX Combination of hepatitis C viral (HCV) antigens, useful in improved
XX immunoassay for detecting HCV antibodies.
XX
XX Example 1; Col 45-60; 58pp; English.
XX
XX The invention relates to combination of hepatitis C viral (HCV) antigens
XX that have a broader range of immunological reactivity than any single HCV
XX antigen. The combinations consist of an antigen from the C domain of the
XX HCV polypeptide, and at least one additional HCV antigen from either the
XX NS3 domain, the NS4 domain, the S domain, or the NS5 domain and are in
XX the form of fusion protein, a simple physical mixture, or the individual
XX antigens commonly bound to a solid matrix. The combinations of antigens
XX provides broad range immunoassays for anti-HCV antibodies. The invention
XX therefore provides a method for detecting antibodies to HCV in a mammal
XX suspected of containing such antibodies. The present sequence is HCV
XX polypeptide. Note: This sequence SEQ ID NO:10 is stated to be similar to
XX the sequence shown in Fig 1 (AAE22052) of the specification. However
XX these sequences differ

FT
FT Combination of hepatitis C viral (HCV) antigens, useful in improved
FT immunoassay for detecting HCV antibodies.
FT
FT Example 1; Fig 1; 59pp; English.
FT
FT The invention relates to combination of hepatitis C viral (HCV) antigens
FT that have a broader range of immunological reactivity than any single HCV
FT antigen. The combinations consist of an antigen from the C domain of the
FT HCV polypeptide, and at least one additional HCV antigen from either the
FT NS3 domain, the NS4 domain, the S domain, or the NS5 domain and are in
FT the form of fusion protein, a simple physical mixture, or the individual
FT antigens commonly bound to a solid matrix. The combinations of antigens
FT therefore provides a method for detecting antibodies to HCV in a mammal
FT suspected of containing such antibodies. The present sequence is HCV
FT polypeptide, alternative version. Note: This sequence SEQ.ID.NO:10 is
FT stated to be similar to the sequence shown in Column 45-60 (AAE22049) of
FT the specification. However these sequences differ

XX CC The invention relates to a secreted polypeptide comprising hepatitis C
XX CC virus (HCV) E2 polypeptide lacking all or a portion of its membrane
XX CC spanning domain so that the E2 polypeptide is capable of secretion into
XX CC growth medium when expressed recombinantly in a host cell. The
XX CC polypeptide may also lack a portion of its C-terminus. The HCV E2
XX CC secreted polypeptide is useful for producing anti-HCV antibodies. A
XX CC purified immunogenic polypeptide comprising HCV E2 is useful for treating
XX CC HCV infection and for providing immune protection against HCV infection
XX CC by administering it to a subject having or at risk of having HCV
XX CC infection or in need of protection. The method further comprises
XX CC administering an immunomodulatory agent such as interleukin-2 (IL-2),
XX CC granulocyte macrophage-colony stimulating factor (GM-CSF) or gamma-
XX CC interferon. The polypeptide is useful as a vaccine, and with other HCV
XX CC proteins to form a multi-component HCV vaccine for prophylactic or
XX CC therapeutic treatment of HCV infection. This sequence represents an HCV
XX CC E2 protein. (Updated on 29-AUG-2003 to standardise OS field)

XX
XX Novel genetically engineered hepatitis C virus, for identifying animal
XX permissive for HCV infection, has positive sense nucleic acid, 5'- and 3'
XX -non-translated regions, open reading frame encoding HCV polyprotein.
XX
XX Example 4; Page 62-70; 120pp; English.
XX
XX The invention relates to a genetically engineered hepatitis C virus (HCV)
XX nucleic acid clone. The genetically engineered HCV is useful for
XX identifying a cell line or animal that is permissive for infection with
XX HCV. The genetically engineered HCV is useful for selecting for HCV with
XX adaptive mutations that permit higher levels of HCV replication in a
XX permissive cell line. The genetically engineered HCV or HCV DNA or RNA is
XX useful for infecting an animal with HCV and for propagating HCV in vitro.
XX The genetically engineered HCV or HCV DNA or RNA is useful for
XX transducing an animal susceptible to HCV infection with a heterologous
XX gene. A host cell line, a non-human animal or an in vitro cell line
XX infected with the HCV genomic RNA of the invention is useful for
XX producing HCV virus particles and for screening for agents capable of
XX modulating HCV replication. The genetically engineered HCV is useful for
XX producing HCV replicon proteins. A HCV virus particle comprising a
XX replication-competent or replication-defective HCV genome RNA is useful
XX for producing antibodies to HCV. A HCV virus particle comprising a
XX replication-competent or replication-defective HCV genome RNA is useful
XX in an in vitro method for detecting antibodies to HCV in a biological
XX sample from a subject. The genetically engineered HCV is useful for
XX therapeutic, vaccine and diagnostic applications. A plasmid encoding the
XX genetically engineered HCV is useful for gene therapy and in gene
XX vaccines. The genetically engineered HCV is useful for expression of
XX functional HCV proteins and infection in vivo and in vitro for
XX development of antiviral therapeutics and diagnostics. A non-human animal
XX or an in vitro cell line infected with the HCV genomic RNA of the
XX invention is useful for studying the natural history of HCV infection,
XX for isolating components of HCV, and for sensitive, fast diagnostic
XX applications. The present sequence represents the amino acid sequence of
XX HCV-H

XX PT New chimeric GBV-B polynucleotide, useful as a model for hepatitis C
XX PT virus, for identifying compounds active against a viral infection, or for
XX PT developing hepatitis C virus preventive and therapeutic treatments.
XX PS Example 23; SEQ ID NO 14; 108pp; English.
XX XX
XX CC This invention relates to novel isolated chimeric GB virus B (GBV-B)/HCV
XX CC polynucleotides. Specifically, it refers to using the hepatotropic
XX CC flavivirus GBV-B that has a unique phylogenetic relationship to the human
XX CC hepatitis C virus (HCV) and can serve as a surrogate virus in drug
XX CC discovery efforts related to antiviral drug development. The present
XX CC invention describes the construction of an infectious molecular clone
XX CC using the newly determined 3' terminal sequence of GBV-B. Furthermore,
XX CC the GBV-B/HCV chimeras exhibit liver-specific expression and express HCV
XX CC envelope proteins such that they can have utility as a vaccine immunogen
XX CC for hepatitis C. In addition, they can be used for screening compounds
XX CC active against viral infection, as well as for developing HCV
XX CC preventative and therapeutic treatments. Accordingly, these compositions
XX CC exhibit virucidal, antiinflammatory and hepatotropic activities. This
XX CC polypeptide sequence is the hepatitis C virus protein sequence of the
XX CC invention.

XX PT Use of Hepatitis C Virus E2 glycoprotein in reducing low density
XX PT lipoprotein levels in a subject or in treating or preventing hepatitis C
XX PT virus infection.
XX XX
XX PS Disclosure; SEQ ID NO 2; 135pp; English.

XX This invention relates to a novel method for identifying inhibitors of
CC the hepatitis C virus (HCV), and also the use of an HCV viral envelope
CC protein identified as E2 glycoprotein in reducing low density lipoprotein
CC (LDL) levels. Specifically, it refers to the knowledge that HCV E2
CC glycoprotein binds to the lipid moiety of human lipoproteins and uses the
CC natural LDL receptor to bind to cells, thus identifies a novel route by
CC which HCV gains entry to the cell providing a novel therapeutic target.
CC The present invention describes screening methods to identify inhibitors
CC of HCV infection that comprises administering a candidate substance with the
CC E2 glycoprotein and a plasma lipoprotein in order to determine a
CC reduction in binding in the presence of an appropriate inhibitor. As
CC such, these compositions can be used to reduce hypercholesterolaemia and
CC in turn treat hyperlipidaemia and associated conditions including
CC coronary heart disease. Accordingly, they exhibit hepatotropic and
CC virucidal activities. This polypeptide sequence is the HCV protein
CC sequence of the invention.

XX New GB virus B and/or hepatitis C virus (HCV) sequences, useful in
PT diagnosing and in treating HCV and in investigating the mechanisms for
PT the different biological properties of the viruses.

XX Disclosure; SEQ ID NO 14; 58pp; English.

XX The invention describes a new isolated polynucleotide (I) encoding a 3'
CC sequence of the GB virus B (GBV-B) genome, or which comprises a chimeric
CC GBV-B genome, where at least part, but not all of a 5' nontranslated
CC region (NTR) sequence is derived from a hepatitis C virus (HCV) 5' NTR.
CC (I) is a GB virus B and/or hepatitis C virus polynucleotide comprising a
CC fully defined of 260 or 9399 bp (SEQ ID NOS: 1 or 2). The polynucleotides
CC or chimaeras are useful diagnosing or treating hepatitis C virus (HCV)

CC and in investigating the mechanisms for the different biological
CC properties of the viruses. This is the amino acid sequence of a hepatitis
CC C virus and can be used in the creation of a chimeric virus comprising
CC domain III of the 5'NTR of HCV (IRES) within a genetic background of GBV-
CC B.

XX Producing infectious hepatitisvirus-like particles ex vivo, comprising
PT transfecting host cells with nucleic acid sequences and maintaining the
PT transfecting cells in culture for sufficient time to allow expression of
PT the cDNAs.

XX Example 1; Page 107-128; 128pp; English.

XX The present invention relates to a method of producing infectious
CC hepatitisvirus-like particles ex vivo, comprising transfecting host cells
CC with nucleic acid sequences and maintaining the transfecting cells in
CC culture for sufficient time to allow expression of the cDNAs to produce
CC structural proteins from hepatitisvirus and retrovirus. The method is useful
CC for producing infectious hepatitisvirus-like particles. The nucleic acid

CC sequences are useful for the preparation of a medicament useful as a
CC vaccine against hepatitis. The hepatitis-like particle that carries a
CC transgene of interest, for the preparation of a medicament for the
CC prevention or treatment of a disease in a patient, where the hepatitis-
CC like particle allows the transfer of the transgene of interest into a
CC cell of the patient, and encodes a product that has a prophylactic or
CC therapeutic effect against the disease. The present sequence contains a
CC number of HCV proteins shown in the exemplification of the invention.

XX New anti- hepatitis C virus (HCV) (AL9) compound, useful as component of
PT anti-HCV vaccines and to expand immune effector cell specific for cells
PT expressing HCV epitope.

XX Claim 4; SEQ ID NO 1; 69pp; English.

XX The present invention describes anti-hepatitis C virus (HCV) (AL9)
CC compounds (I) having the amino acid sequences of SEQ ID NO:3, 5 and 7
CC (ADR29359, ADR29361 and ADR29363). Also described: (i) a peptide (II)
CC comprising the 3011 amino acid sequence of SEQ ID NO:1 (S1, ADR29357),
CC where in (S1) positions 2594-2602 are Phe, Ile, Leu, Trp, Pro, Glu, Asn,
CC Lys, and Val (SEQ ID NO:3), respectively or Phe, Leu, Pro, Trp, Gly, Ala,
CC Trp, Lys, and Val (SEQ ID NO:5) respectively; (2) a polynucleotide (III)
CC that encodes Phe-Leu-Ile-Trp-Pro-Glu-Asn-Lys-Val; Phe-Leu-Pro-Trp-Gly-Ala
CC -Trp-Lys-Val, or Ala-Leu-Tyr-Asp-Val-Thr-Lys-Leu (SEQ ID NO:3, 5 or 7);

CC (3) an antibody (IV) that recognises and binds to (I); (4) an immune
CC effector cell (V) that has been raised in vivo or in vitro or in the
CC presence and the expense of an antigen presenting cell that presents (I),
CC in the context of an MHC molecule; (5) a composition (VI) comprising (I),
CC of SEQ ID NO:3, 5 or 7 where (I) is individually characterised by an
CC ability to elicit an immune response against the same native ligand; (6)
CC a composition (VII) comprising (I) and a carrier; (7) a host cell (VIII)
CC comprising at least one or more (I) of SEQ ID NO:3, 5 or 7 that are
CC individually characterised by an ability to elicit an immune response
CC against the same native ligand; and (8) a composition comprising (VIII)
CC and a carrier. (I) have anti-HIV, virucide, antiinflammatory,
CC hepatotropic and immunostimulant activities, and can be used in vaccines.
CC (I) can be used for inducing an immune response in a subject which
CC involves delivering (I) to the subject. (I) is delivered in the context
CC of an MHC molecule. The MHC molecules presents (I) on the surface of an
CC antigen presenting cell. (I) is delivered as a polynucleotide that
CC encodes it. (IV) is useful for immunotherapy. (V) is useful for adoptive
CC immunotherapy. (VI) is useful for inducing an immune response in a
CC subject. (I) is useful as components of anti-HCV vaccines and to expand
CC immune effector cell that are specific for cells expressing HCV epitope.
CC (I) is useful for preparation of medicament for diagnosis and treatment
CC of diseases such as AIDS. The present sequence represents the hepatitis C
CC virus polypeptide precursor, which is used in the exemplification of the
CC present invention.

XX
XX The invention relates to sequences encoding hepatitis C virus (HCV)
CC glycoproteins. Envelope glycoproteins play a crucial role in viral
CC infectivity through their direct effect on processes including packaging
CC of virions, attachment to target cells, fusion and budding. In
CC particular, glycoproteins E1 and E2 are thought to be involved in
CC mediating virus entry into target cells. E1 and E2 are present as a non-
CC covalently associated heterodimer on the virus surface and undergo
CC modification by N-linked glycosylation. The new invention provides a
CC modified nucleic acid having a sequence encoding a full length hepatitis
CC C virus (HCV) glycoprotein consisting of E1 glycoprotein and E1/E2

XX
PS Disclosure; Page 388-440; 458pp; English.
XX
XX The invention relates to a method of identifying a candidate peptide

CC glycoprotein heterodimer, which has at least one nucleotide alteration.
CC The alteration removes a RNA splice acceptor and RNA splice donor site
CC from the coding sequence. The elimination reduces an extent to which an
CC intron is excised from the coding sequence. The alteration comprises a
CC mutation in the HCV E1 coding sequence (SEQ ID NO: 2), so that a splice-
CC acceptor, or splice donor site is eliminated. Also disclosed is a method
CC of screening agents, to identify one that inhibits fusion; and an agent
CC that inhibits fusion or entry of HCV to a target cell capable of fusing
CC with the virus. The agent is an antibody, a peptide, a non-peptidyl agent
CC or a small molecule. Provided are methods of treating a subject with a
CC HCV-associated disorder; inhibiting the onset of a HCV-associated
CC hepatitis, liver cirrhosis and hepatocellular carcinoma. A diagnostic kit
CC is described comprising an antibody and instructions for detecting HCV in
CC human tissue. Treatment involves injecting a HCV glycoprotein or the
CC modified nucleic acid in a vector capable of expressing a HCV
CC glycoprotein. The present sequence is the full length amino acid
CC consensus sequence of the hepatitis C virus genome.

New replication competent polynucleotide comprising a 5' non-translated

region (NTR), a 3' NTR, and a first coding sequence present between the

5' NTR and 3' NTR and encoding a hepatitis C virus polyprotein, useful in

drug discovery.

Disclosure; SEQ ID NO 2; 102pp; English.

The present sequence is that of the hepatitis C virus (HCV) strain H77

polyprotein. The invention provides replication competent polynucleotides

that include a 5' non-translated region (NTR), a 3' NTR and a coding

sequence encoding an HCV polyprotein that comprises an Ile residue at

about amino acid 2204, and an adaptive mutation selected from Arg at

about amino acid 1067, Arg at about amino acid 1691, Val at about amino

acid 2080, Ile at about amino acid 1655, Arg at about amino acid 2040,

and Arg at about amino acid 1188, or a combination of these. The

polyprotein may include the cleavage products core, E1, E2, P7, NS2,

NS4A, NS4B, NS5A and NS5B. The polynucleotide may further comprise a

second coding sequence encoding a marker or transactivator, or a

nucleotide sequence having cis-acting ribozyme activity located 3' of the

3' NTR. Also provided are: a method for making the replication component

polynucleotide; a method for using the replication component

polynucleotide to identify a compound that inhibits replication of the

replication competent nucleotide; a method for selecting a replication

competent polynucleotide; and a method for detecting a replication

competent polynucleotide.

Detecting replication competent hepatitis C virus (HCV) RNA by incubating a vertebrate cell comprising an HCV RNA and detecting the detectable marker, where its presence indicates the cell comprises a replication competent HCV RNA.
Disclosure; SEQ ID NO 20; 142pp; English.
The present invention provides a replication competent hepatitis C virus (HCV) RNA that includes a heterologous polynucleotide. The invention also includes methods for modifying a HCV polynucleotide, selecting a replication competent HCV polynucleotide, detecting a replication competent HCV polynucleotide and identifying a compound that inhibits

CC replication of a HCV polynucleotide. The present sequence is hepatitis C
CC virus (HCV) MKO-Z (full-length modified cDNA) protein. This sequence
CC includes 5' non-translated RNA (5' NTR), core protein, envelope
CC glycoproteins (E1 and E2) and six non-structural replicative proteins
CC which includes NS2 (which demonstrates cis active metalloproteinase
CC activity at the NS2/NS3 cleavage site), NS3 (a serine
CC proteinase/NTase/RNA helicase), NS4A (serine proteinase accessory
CC factor), NS4B, NS5A and NS5B (RNA-dependent RNA polymerase). This
CC sequence is encoded by a portion (corresponding to nucleotides 342 to
CC 10803) of hepatitis C virus MKO-Z (full length modified cDNA) protein.

CC The present invention relates to a new DNA or RNA comprising a hepatitis
CC C virus (HCV) sequence capable of productive replication in a host cell.
CC The molecules of the invention comprise 5' to 3' on the positive sense 5'
CC strand a functional HCV 5' non-translated region comprising an extreme 5'
CC -terminal conserved sequence, an HCV polyprotein coding region and a
CC functional HCV 3' non-translated region comprising an extreme 3'-terminal
CC conserved region. The DNA or RNA is used to detect and develop treatment
CC for infection by hepatitis C virus. The present amino acid sequence
CC represents the hepatitis C virus (HCV) H77 consensus protein

PT	Novel genetically engineered hepatitis C virus, for identifying animal permissive for HCV infection, has positive sense nucleic acid, 5'- and 3'-non-translated regions, open reading frame encoding HCV polyprotein.
PS	Disclosure; Page 41-48; 120pp; English.
CC	The invention relates to a genetically engineered hepatitis C virus (HCV) nucleic acid clone. The genetically engineered HCV is useful for identifying a cell line or animal that is permissive for infection with HCV. The genetically engineered HCV is useful selecting for HCV with adaptive mutations that permit higher levels of HCV replication in a permissive cell line. The genetically engineered HCV DNA or RNA is useful for infecting an animal with HCV and for propagating HCV in vitro. The genetically engineered HCV or HCV DNA or RNA is useful for transducing an animal susceptible to HCV infection with a heterologous gene. A host cell line, a non-human animal or an in vitro cell line infected with the HCV genomic RNA of the invention is useful for producing HCV virus particles and for screening for agents capable of modulating HCV replication. The genetically engineered HCV is useful for producing HCV particle proteins. A HCV virus particle comprising a replication-competent or replication-defective HCV genome RNA is useful for producing antibodies to HCV. A HCV virus particle comprising a replication-competent or replication-defective HCV genome RNA is useful in an in vitro method for detecting antibodies to HCV in a biological sample from a subject. The genetically engineered HCV is useful for therapeutically, vaccine and diagnostic applications. A plasmid encoding the genetically engineered HCV is useful for gene therapy and in gene

XX Novel replication competent hepatitis C virus for producing infectious
PT viral particles and as antigen for detecting hepatitis C virus
PT antibodies, comprises hepatitis C virus genome and heterologous
PT polynucleotide.
XX Disclosure; Fig 10; 37pp; English.
XX The invention discloses a replication competent hepatitis C virus (HCV)
CC comprising a HCV virus genome and a heterologous polynucleotide, where
CC the HCV genome comprises a 3' non-translated RNA and the heterologous
CC polynucleotide is present in the 3' non-translated RNA. HCV is a cause of
CC chronic viral hepatitis, hepatic fibrosis, cirrhosis and/or the
CC development of hepatocellular carcinoma. A cell comprising the HCV is
CC useful for selecting or detecting a replication competent HCV, for
CC identifying a compound that inhibits replication of HCV, for producing
CC infectious viral particles which are useful as a source of virus
CC particles for various assays, including evaluating methods for
CC inactivating particles, excluding particles from serum, identifying a
CC neutralising compound and as an antigen for use in detecting anti-HCV
CC antibodies in an animal. The cell comprising the HCV is also useful for
CC identifying a variant HCV. An HCV particle is useful as an antigen, as a
CC positive-control in assays that test for the presence of anti-HCV
CC antibodies, to produce antibodies to detect the presence of viral
CC particles in biological samples (e.g. blood products and cell-free blood
CC products) and as a source of viral antigen to measure the presence and
CC amount of antibody present in an animal. The sequence presented is the
CC viral polypeptides encoded by the modified HCV (MKO-Z) polynucleotide

XX Identifying a compound that inhibits replication of a hepatitis C virus
XX (HCV) RNA comprises contacting a cell comprising a replication competent
XX HCV RNA containing a heterologous polynucleotide encoding a
XX transactivator, with a compound.
XX
XX Disclosure; SEQ ID NO 20; 95pp; English.
XX
XX The invention describes a method of identifying a compound that inhibits
XX replication of a hepatitis C virus (HCV) RNA. The method comprises
XX contacting a cell comprising a replication competent HCV RNA containing a
XX heterologous polynucleotide having a first coding sequence encoding a
XX transactivator, with a compound. The method is useful for identifying a
XX compound that inhibits replication of HCV RNA. The kit is useful for
XX detecting replication competent HCV RNA. This is the amino acid sequence
XX of hepatitis C virus polyprotein.

XX
XX Use of at least one set of peptides in the preparation of a medicament
XX for modulating an immune response, and for treating cancer or yeast,
XX viral, bacterial, protozoal and mycoplasma infections.
XX
XX Disclosure; SEQ ID NO 2196; 645pp; English.
XX
XX The invention relates to the use of at least one set of peptides in the
XX preparation of a medicament for modulating an immune response, where
XX individual peptides of a respective set comprise different portions of an
XX amino acid sequence corresponding to a single polypeptide of interest and
XX display partial sequence identity or similarity to at least one other
XX peptide of the same set of peptides (i.e. they are overlapping). Also
XX included are an antigen-presenting cell which has been contacted with the
XX peptides above and thus presents the peptides, a population of such
XX antigen-presenting cells, a process for producing antigen-presenting
XX cells for modulating an immune response to a polypeptide of interest, a
XX method for producing antigen-specific lymphocytes, a composition
XX comprising at least one set of the peptides (and a carrier and/or
XX diluent), a method for modulating an immune response to a polypeptide of
XX interest comprising administering to a patient in need at least one set
XX of the peptides, a method for treatment and/or prophylaxis of a disease
XX or condition associated with the presence of a polypeptide of interest
XX and a composition of matter for modulating an immune response in a
XX subject to a target antigen. The polypeptide of interest is also a
XX disease- or condition-associated polypeptide that is a polypeptide
XX produced by a pathogenic organism or a cancer, and produced by a
XX pathogenic organism selected from yeast, viruses, bacteria, helminths,
XX protozoans and mycoplasmas. The disease- or condition-associated
XX polypeptide is produced by a cancer selected from melanoma, lung cancer,
XX breast cancer, cervical cancer, prostate cancer, colon cancer, pancreatic
XX cancer, stomach cancer, bladder cancer, kidney cancer, post transplant
XX lymphoproliferative disease (PTLD) or Hodgkin's lymphoma. The uncultured
XX antigen-presenting cells or their precursors are useful in the
XX preparation of a medicament for the treatment of a disease or condition
XX in a subject, which disease or condition is associated with the presence
XX of aberrant expression of a target antigen, where the antigen-presenting
XX cells or their precursors have not been subjected to activating
XX conditions but have been contacted with an antigen that corresponds to
XX the target antigen to express a processed or modified form of the antigen
XX for presentation to the subject's immune system. The present sequence is
XX a viral protein from which a set of overlapping immunogenic peptides was
XX derived.

XX PT New synthetic polypeptides having several different segments of at least
PT one parent polypeptide linked together differently compared to the
PT linkage in the parent polypeptide, for inducing immune response against a
PT pathogen or cancer.

XX PS Example 2; Fig 26; 364pp; English.

XX CC The invention relates to a new synthetic polypeptide (I) comprising
CC several different segments of at least one parent polypeptide linked
CC together in a different relationship relative to their linkage in the
CC parent polypeptide to impede, abrogate or otherwise alter at least one
CC function associated with the parent polypeptide and for inducing an
CC immune response against a pathogen or cancer. Also included are a
CC synthetic polynucleotide encoding and a computer system for designing the
CC synthetic polypeptides. The synthetic polypeptides and polynucleotides
CC are referred to as a Savine. The synthetic polypeptide is useful for
CC modulating immune responses preferably directed against a pathogen or a
CC cancer, (e.g., cancers of the lung, breast, ovary, cervix, colon, head
CC and neck, pancreas, prostate, stomach, bladder, kidney, bone liver,
CC oesophagus, brain, testicle, uterus), as potentiating agents.
CC Compositions comprising the polypeptide may be used in the treatment or
CC prophylaxis against viral (such as infections caused by HIV (human
CC immunodeficiency virus), hepatitis, influenza, Japanese encephalitis
CC virus, Epstein-Barr virus and respiratory syncytial virus), bacterial
CC (e.g., infections caused by Neisseria, Meningococcal, Haemophilus,
CC Salmonella, Streptococcal, Legionella and Mycobacterium or parasitic
CC (e.g., infections caused by Plasmodium, Schistosoma, Leishmania,
CC Trypanosoma, Toxoplasma and Giardia) infections. The present sequence is
CC a cassette protein consisting of several peptides derived from a parent
CC protein. One or more cassettes are used to construct a savine of the
CC invention

PT New hepatitis C virus covalent complexes.

XX Disclosure; Page 110; 211pp; English.

XX The present invention describes a covalent hepatitis C virus (HCV) NS4A-
CC NS3 complex comprising a central hydrophobic domain of native HCV NS4A
CC peptide, a linker, and an HCV NS3 serine protease domain, where the
CC hydrophobic domain of native HCV NS4A peptide is tethered by the linker
CC to the amino terminus of the HCV NS3 protease domain. The covalent NS4A-
CC NS3 complexes are useful for structural determination and determination
CC of mode of binding of HCV inhibitors by NMR spectroscopy. They can also
CC be used for detecting inhibitors of the protease activity, the helicase
CC activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes
CC are more soluble, stable and active than the non-covalent protease-
CC peptide complexes previously available. The present sequence represents
CC the native NS4A peptide

XX DR Increasing the expression of a nucleic acid in a cell comprises providing
XX PT a first nucleic acid encoding a hepatitis C virus (HCV) non-structural
XX PT protein 4A (NS4A) or its functional portion.
XX PS Claim 10; SEQ ID NO 2; 43pp; English.
XX CC The invention relates to a method of increasing the expression of a
XX CC desired nucleic acid in a cell by associating it with a nucleic acid
XX CC encoding the hepatitis C virus (HCV) non-structural protein 4A (NS4A) or
XX CC a functional portion thereof. The desired nucleic acid to be expressed is
XX CC preferably one encoding the HCV non-structural protein 3 (NS3), and the
XX CC desired nucleic acid and the NS4A gene acts as an enhancer that increases
XX CC both the transcription and also the immunogenicity of an associated
XX CC nucleic acid such as the NS3 gene. The invention also relates to a method
XX CC of increasing immunogenicity of an antigen (preferably the HCV NS3
XX CC protein) in a mammal by associating the antigen-encoding nucleic acid
XX CC with an NS4A nucleic acid, again either on the same or on different
XX CC constructs. The methods of the invention are useful for increasing the
XX CC expression and immunogenicity of a nucleic acid of interest and have
XX CC application in the production of genetic vaccines. The present sequence
XX CC represents the HCV NS4A protein, a nucleic acid encoding all or part of
XX CC which may be used as an enhancer in the method of the invention.

XX DR Increasing the expression of a nucleic acid in a cell comprises providing
XX PT a first nucleic acid encoding a hepatitis C virus (HCV) non-structural
XX PT protein 4A (NS4A) or its functional portion.
XX PS Example 1; Page; 43pp; English.
XX CC The invention relates to a method of increasing the expression of a
XX CC desired nucleic acid in a cell by associating it with a nucleic acid
XX CC encoding the hepatitis C virus (HCV) non-structural protein 4A (NS4A) or
XX CC a functional portion thereof. The desired nucleic acid to be expressed is
XX CC preferably one encoding the HCV non-structural protein 3 (NS3), and the
XX CC desired nucleic acid and the NS4A gene acts as an enhancer that increases
XX CC both the transcription and also the immunogenicity of an associated
XX CC nucleic acid such as the NS3 gene. The invention also relates to a method
XX CC of increasing immunogenicity of an antigen (preferably the HCV NS3
XX CC protein) in a mammal by associating the antigen-encoding nucleic acid
XX CC with an NS4A nucleic acid, again either on the same or on different
XX CC constructs. The methods of the invention are useful for increasing the
XX CC expression and immunogenicity of a nucleic acid of interest and have
XX CC application in the production of genetic vaccines. The present sequence
XX CC represents a mutant HCV NS4A protein, a nucleic acid encoding which was
XX CC used in an example of the invention. Note: The present sequence is not
XX CC shown in the patent, but is derived from the wild-type HCV NS4A sequence
XX CC (ADP04992) and the information given on page 8.

XX
XX The sequences given in AAR29559-60 and AAR29843-51 were encoded
CC by clones which encode the NS2-NS4 regions of the Hepatitis C virus (HCV)
CC gene of the invention. These sequences were isolated from the serum of a
CC patient suffering from hepatitis C (HC). The NS2-NS4 RNA sequences were
CC converted into cDNA using transcriptase in the presence of one of the
CC primer sequences given in AAQ32553-64. The cDNA sequences were then
CC amplified using primer pairs. The cDNA sequences isolated represent
CC different alleles of the same region of the HCV gene. Sequence
CC comparisons of these clones showed that it is possible for a patient to
CC carry more than one HCV strain at one time. See also AAQ32436. (Updated
CC on 25-MAR-2003 to correct PN field.)

 XX
 PT New recombinant polypeptide for diagnosing hepatitis C - contains three
 PT distinct antigens from different viral regions, also useful in protective
 PT vaccines.
 XX
 PS Example 1; Page 64-66; 99pp; English.
 XX
 CC The NS4 region from the 3' region of the PT-NANBH genome (AAQ46195) is
 CC amplified by PCR using primers D224 and D226 (AAQ46196-97) and the
 CC fragment (AAQ46198) is cloned into a vector and expressed in infected
 CC insect cells. The recombinant virus (BHC-19) was able to express the NS4
 CC specific recombinant protein at low levels in the infected insect cells.
 CC If at least three different PT-NANBH antigens are used to screen for PT-
 CC NANBH, the screening is much more sensitive as compared to the use of
 CC only two PT-NANBH antigens. Pref. antigens are described in AAQ46192-94.
 CC Two new antigenic regions of the PT-NANBH genome are given in AAQ46198-
 CC 99. AAQ46202 describes an improved PT-NANBH recombinant polypeptide.

 CC The sequences given in AAR29852-70 are encoded by various clones which
 CC were used in the isolation of the NS2-NS4 regions of the Hepatitis C
 CC Virus (HCV) gene of the invention (see also AAR29660, AAR29559-60 and
 CC AAR29843-51). These RNA sequences were isolated from the serum of a
 CC patient suffering from hepatitis C (HC). The isolated RNA sequences were
 CC converted into cDNA using transcriptase in the presence of one of the
 CC primer sequences given in AAQ32578-79. The sequences were then amplified
 CC using primer pairs. The cDNA sequences isolated represent different
 CC alleles of the same region of the HCV gene. Sequence comparisons of these
 CC clones showed that it is possible for a patient to carry more than one
 CC HCV strain at one time. See also AAQ32436. (Updated on 25-MAR-2003 to

XX Drug resistant mutants of hepatitis C virus (HCV) NS3/4A protease, useful

PT in assessing HCV infections in patients, and in screening for new

PT antiviral drugs.

XX Claim 17; Page; 113pp; English.

XX The invention relates to a novel isolated Hepatitis C virus (HCV)

CC polynucleotide encoding an HCV NS3/4A protease or its biologically active

CC analog, where the codon that corresponds to codon 156 of the wild-type

CC polynucleotide and/or the codon that corresponds to codon 168 of the wild

CC -type polynucleotide is mutated so that it does not encode an alanine at

CC 156 and/or aspartic acid at 168. The HCV NS protein 3 (NS3) contains a

CC serine protease activity that processes the viral polyprotein to generate

CC the majority of the viral enzymes, and is essential for viral replication

CC and infectivity. NS4A is an associated cofactor of NS3. The

CC polynucleotide of the invention demonstrates antiinflammatory,

CC hepatotropic and virucide activities and may be useful in assessing

CC Hepatitis C virus (HCV) infections in patients, as well as in screening

CC for new therapeutics targeting the HCV NS3/4A protease. Compounds
CC identified by the methods may be useful for treating HCV infections and
CC for eliminating or reducing HCV contamination of biological samples and
CC medical and laboratory equipment. The current sequence is that of the HCV
CC NS3/4A serine protease mutant protein 2 of the invention. The current
CC sequence is not shown within the specification per se but was created by
CC the indexer using information in claim 17.

 XX Novel non-A non-B type hepatitis virus nucleic acid fragment useful for
 diagnosing non-A non-B hepatitis patient and non-A non-B type hepatitis
 virus carrier.
 XX Disclosure; Page 30-32; 35pp; Japanese.
 XX This invention relates to a novel isolated nucleic acid fragment encoding
 a non-A non-B type hepatitis virus antigen protein sequence.
 CC Specifically, it refers to a method for diagnosing non-A non-B type
 CC hepatitis patients, as well as for detecting those people who are
 CC carriers. The present invention describes a diagnosis method that uses a
 CC hepatitis C virus antibody detection reagent and subsequent PCR
 CC amplification to identify a clone C260-1 that encodes the non-A non-B
 CC type hepatitis virus antigen sequence. This polypeptide sequence is the
 CC non-A non-B type hepatitis virus protein fragment of the invention. NOTE:
 CC This sequence is given in the sequence listing as an embedded protein and
 CC is not further referred to in the specification.

XX New hepatitis C virus gene and its encoded protein - used for diagnosing

PT and vaccinating against hepatitis C virus infections.

XX Disclosure; Page 178-82; 305pp; English.

XX The sequences given in AAR29852-70 are encoded by various clones which
CC were used in the isolation of the NS2-NS4 regions of the Hepatitis C
CC Virus (HCV) gene of the invention (see also AAR29660, AAR29559-60 and
CC AAR29843-51). These RNA sequences were isolated from the serum of a
CC patient suffering from hepatitis C (HC). The isolated RNA sequences were
CC converted into cDNA using transcriptase in the presence of one of the
CC primer sequences given in AAQ32578-79. The sequences were then amplified
CC using primer pairs. The cDNA sequences isolated represent different
CC alleles of the same region of the HCV gene. Sequence comparisons of these
CC clones showed that it is possible for a patient to carry more than one
CC HCV strain at one time. See also AAQ32436. (Updated on 25-MAR-2003 to
CC correct PN field.)

PT

XX treating hepatitis C.

XX

XX Claim 4; SEQ ID NO 3; 46pp; English.

PS

XX The invention relates to a novel method for enhancing the ability of a

CC

CC genotype 2b NS5B sequence to function in a replicon. The method comprises

CC

CC altering either or both the genotype 2b NS5B sequence to encode one or

CC

CC more adaptive mutations, or a genotype 1b NS4B sequence to encode an

CC

CC adaptive mutation of alanine at position 218 of a fully defined 261 amino

CC

CC acid (AEA32874) sequence given in the specification. The invention

CC

CC further comprises: a method for producing a chimeric replicon, comprising

CC

CC replacing substantially all of an NS5B sequence of a hepatitis C virus

CC

CC (HCV) replicon encoding a fully defined 1394 amino acid (AEA32849)

CC

CC sequence, with a genotype 2b NS5B encoding nucleic acid sequence; a

CC

CC chimeric replicon comprising an NS3-5A sequence of a genotype 1b replicon

CC

CC or a modified 2b NS3-5A sequence of a genotype 1b replicon, where NS4B

CC

CC contains a Val-218-Ala modification, and substantially all of a genotype

CC

CC 2b NS5B encoding nucleic acid sequence; and a recombinant cell comprising

CC a replicon of one of the methods or chimeric replicon, where the replicon
 CC is expressed in the cell. The method has virucide activity. The method is
 CC useful for enhancing the ability of a genotype 2b NS5B sequence to
 CC function in a replicon. The chimeric replicon and recombinant cell are
 CC useful for measuring the ability of a compound to inhibit replicon
 CC activity. The compounds tested can be used to treat or inhibit the onset
 CC of hepatitis C virus (HCV) infection in a patient. The method is useful
 CC for producing replicons containing functional genotype 2b NS5B. This
 CC sequence represents a NS3-5A genotype 1b protein used in the novel method
 CC of the invention.

XX New hepatitis C virus gene and its encoded protein - used for diagnosing
 PT and vaccinating against hepatitis C virus infections.

XX Disclosure; Page 216-24; 305pp; English.

XX The sequences given in AAR29871-81 and AAR29533 are encoded by various
 CC clones of the NS4-NS5 regions of the Hepatitis C Virus (HCV) gene of the
 CC invention. These NS4-NS5 RNA sequences were isolated from the serum of a
 CC patient suffering from hepatitis C (HC). The isolated RNA sequences were
 CC converted into cDNA using transcriptase in the presence of one of the
 CC primer sequences given in AAQ32565-77. The sequences were then amplified
 CC using primer pairs. The cDNA sequences isolated represent different
 CC alleles of the same region of the HCV gene. Sequence analysis shows that
 CC these clones represent the core region and some upstream sequences of
 CC HCV. These polypeptides are thought to contain a highly hydrophilic

CC region which can adopt a "turn structure" which is not an alpha helix or
 CC a beta sheet. These polypeptides are thought to act as antigen
 CC determinants and are highly reactive with antiserum raised against HCV-
 CC associated antigens. See also AAQ32436. (Updated on 25-MAR-2003 to
 CC correct PN field.)

XX Surrogate cell-based system for assaying hepatitis C virus (HCV) NS3
 PT protease activity, comprises chimeric DNA containing a transactivator
 PT domain fused downstream of a HCV DNA molecule encoding NS3-5 polyprotein.

XX Claim 9; Page 63-68; 70pp; English.

XX The present invention relates to a surrogate cell-based system to
 CC evaluate the activity of hepatitis C virus (HCV). The system involves a
 CC chimeric DNA molecule with a non-cytopathic expression system, a HCV
 CC recombinant DNA molecule encoding NS3-5 polyprotein linked to the
 CC expression system and a transactivator domain fused downstream of HCV DNA
 CC molecule and a second chimeric DNA molecule encoding a reporter gene. The
 CC surrogate cell-based system is useful for evaluating the activity of
 CC hepatitis C virus NS3 protease and is useful for identifying potential
 CC inhibitors of HCV NS3 protease activity. (Updated on 06-AUG-2003 to
 CC correct OS field.)

XX Novel nucleic acid encoding replication competent recombinant hepatitis C
PT virus genome useful for screening anti-hepatitis C virus therapeutics and
PT for vaccine development.
XX
XX Claim 6; Page 50-51; 85pp; English.
XX
XX The present invention provides protein and coding sequences from
CC Hepatitis C virus (HCV), comprising all or part of the HCV genome and
CC able to replicate efficiently when transfected into a susceptible cell
CC line without reducing the growth rate of the cell line by more than 10
CC fold. The sequences are useful for screening for anti-HCV therapeutics,
CC for detecting antibodies to HCV in a biological sample such as blood,
CC serum, plasma, blood cells, lymphocytes, or liver cells from a subject,
CC for deriving authentic HCV components such as replication-component non-
CC infectious, replication-defective infection-component, and replication-
CC defective non-infectious HCV, in gene therapy or gene vaccination
CC targeted to hepatic tissue for treating an animal infected or susceptible
CC to HCV infection and for studying HCV infection and propagation. The
CC present sequence is the HCV NS3 proteinase/helicase

XX
XX The invention relates to Hepatitis C virus (HCV) variants which include
CC polynucleotides comprising non-naturally occurring HCV sequence and HCV
CC variants that have a transfection efficiency and ability to survive
CC subpassage greater than HCV that have wild-type polyprotein coding
CC regions. The polynucleotides of the invention are useful for identifying
CC a cell line that is permissive for infection with HCV and detecting for
CC replication of HCV in cells of the cell line. They are also useful for
CC testing a compound for anti-viral properties and for inhibiting HCV
CC infection. They are also useful for the generation of defined HCV virus
CC stocks to develop in vitro and in vivo assays for virus neutralisation,
CC attachment, penetration and entry, structure/function studies on HCV
CC proteins and RNA elements and identification of new antiviral targets, a
CC systematic survey of cell culture systems and conditions to identify
CC those that support wild-type and variant HCV RNA replication and particle
CC release, production of adaptive HCV variants capable of more efficiency
CC replication in cell culture, production of HCV variants with altered
CC tissue or species tropism, establishment of alternative animal models for
CC inhibitor evaluation including those supporting HCV variant replication,
CC development of cell-free HCV replication assays, production of
CC immunogenic HCV particles for vaccination, engineering of attenuated or
CC defective HCV derivatives for expression of heterologous gene products
CC for gene therapy and vaccine applications and for utilisation of the HCV
CC glycoproteins for targeted delivery of therapeutic agents to the liver
CC or other cell types with appropriate receptors. Vaccine comprising these
CC sequences is useful for inducing immunoprotection to HCV in a primate.
CC The present sequence is Hepatitis C virus (HCV) replBartMan polyprotein
CC variant. Note: The present sequence is not shown in the specification but

XX
XX Use of hepatitis C virus assays or reporter assays, e.g. identifying a
XX compound that inhibits hepatitis C virus RNA replication or identifying a
XX compound that modulates the activity of a gene of interest.
XX
XX Claim 4; SEQ ID NO 2; 45pp; English.
XX
XX The present invention relates to the use of hepatitis C virus (HCV)
XX assays for identifying a compound that inhibits HCV RNA replication and
XX reporter assays for identifying a compound that modulates the activity of
XX a gene of interest. The assays are useful for identifying a compound that
XX inhibits HCV RNA replication or for identifying a compound that modulates
XX the activity of a gene of interest. The HCV assay is useful for high
XX throughput screening that quantifies both the amount of HCV RNA
XX replication inhibitory activity associated with a test compound and the
XX amount of cytotoxicity associated with the test compound. The compound is
XX useful for treating hepatitis C infection. Assays of the invention have
XX distinct advantages when compared to qRT-PCR or other methods in that
XX assays of the invention may take place in situ in a detergent based crude
XX cell lysate, which requires no further preparation prior to performing
XX the assays. The assays do not also involve numerous manipulations to add
XX or subtract reagents after addition of test compounds and are desirably
XX based on a viral protein which is required by the HCV replicon for
XX replication. The present sequence represents a HCV replicon used in the
XX assay of the invention.

XX
XX Making Hepatitis C virus (HCV) replicon having increased replication
XX activity, useful in HCV research, comprises modifying HCV replicon
XX construct to encode an amino acid substitution at a position
XX corresponding to amino acid 470 of NS3.
XX
XX Claim 9; SEQ ID NO 1; 54pp; English.
XX
XX This invention relates to a novel method for producing a Hepatitis C
XX virus (HCV) replicon having an increased replication activity.
XX Specifically, it refers to modifying an HCV replicon construct to encode
XX an amino acid substitution in NS3 (a non-structural protein that along
XX with NS4A, NS4B, NS5A and NS5B make up the virus replication machinery
XX released in the form of a polyprotein). The present invention describes
XX an amino acid substitution at a position corresponding to amino acid 470
XX of NS3 alone, or in combination with, an isoleucine in a position
XX corresponding to amino acid 232 of NS5A that confers improved cell
XX culture replication activity compared to wild type HCV. The method is
XX useful for facilitating the identification of broadly efficacious
XX compounds against different HCV isolates and facilitating HCV research,
XX where compounds that inhibit HCV replication have research and
XX therapeutic applications in identifying overall efficacy and lack of
XX unacceptable toxicity. Accordingly, they can be used to treat or inhibit
XX the onset of HCV in a patient. This polypeptide sequence is the HCV NS3-
XX NS5B polyprotein based on HCV-BK with a 471M mutation (corresponds to

CC 470M of the NS3 protein) and 11791 mutation, given in an exemplification
CC of the invention.

XX Detecting replication competent hepatitis C virus (HCV) RNA by incubating
FT a vertebrate cell comprising an HCV RNA and detecting the detectable
PT marker, where its presence indicates the cell comprises a replication
PT competent HCV RNA.

XX Disclosure; SEQ ID NO 42; 142pp; English.

XX The present invention provides a replication competent hepatitis C virus
CC (HCV) RNA that includes a heterologous polynucleotide. The invention also
CC includes methods for modifying a HCV polynucleotide, selecting a
CC replication competent HCV polynucleotide, detecting a replication
CC competent HCV polynucleotide and identifying a compound that inhibits

CC replication of a HCV polynucleotide. The present sequence is hepatitis C
CC virus (HCV) isolate Con1 polyprotein. This sequence includes non-
CC structural replicative proteins which includes NS3 (a serine
CC proteinase/NTase/RNA helicase), NS4A (serine proteinase accessory
CC factor), NS4B, NS5A and NS5B (RNA-dependent RNA polymerase) and 3' non-
CC translated region (3' NTR). Note: The present sequence is the SEQ ID NO:
CC 42 which is given in the sequence listing. This sequence differs from the
CC SEQ ID NO: 42 shown in the disclosure (figure 24e) of the specification.

XX Identifying a compound that inhibits replication of a hepatitis C virus
PT (HCV) RNA comprises contacting a cell comprising a replication competent
PT HCV RNA containing a heterologous polynucleotide encoding a
PT transactivator, with a compound.

XX Disclosure; Fig 24; 95pp; English.

XX The invention describes a method of identifying a compound that inhibits
CC replication of a hepatitis C virus (HCV) RNA. The method comprises
CC contacting a cell comprising a replication competent HCV RNA containing a
CC heterologous polynucleotide having a first coding sequence encoding a
CC transactivator, with a compound. The method is useful for identifying a
CC compound that inhibits replication of HCV RNA. The kit is useful for
CC detecting replication competent HCV RNA. This is the amino acid sequence
CC of hepatitis C virus polyprotein.

Detecting replication competent hepatitis C virus (HCV) RNA by incubating a vertebrate cell comprising an HCV RNA and detecting the detectable marker, where its presence indicates the cell comprises a replication competent HCV RNA.

Disclosure; SEQ ID NO 42; 142pp; English.

The present invention provides a replication competent hepatitis C virus

CC (HCV) RNA that includes a heterologous polynucleotide. The invention also includes methods for modifying a HCV polynucleotide, selecting a replication competent HCV polynucleotide, detecting a replication competent HCV polynucleotide and identifying a compound that inhibits replication of a HCV polynucleotide. The present sequence is hepatitis C virus (HCV) Isolate Con1 polyprotein. This sequence includes non-structural replicative proteins which includes NS3 (a serine proteinase/NTase/RNA helicase), NS4A (serine proteinase accessory factor), NS4B, NS5A and NS5B (RNA-dependent RNA polymerase) and 3' non-translated region (3' NTR). Note: The present sequence is the SEQ ID NO: 42 which is shown in the disclosure (figure 24e) of the specification. This sequence differs from the SEQ ID NO: 42 given in the sequence listing of the specification.

Reproducing enzymatic activities of HCV in vitro - using sequences contg. NS5B for RNA-dependent RNA polymerase and terminal nucleotidyl transferase activities.

Example 1; Page 26-34; 49pp; English.

A novel method for reproducing in vitro the RNA-dependent RNA polymerase (RdRp) activity or the terminal nucleotidyl transferase (TNTase) activity encoded by hepatitis C virus (HCV), is characterised in that sequences contg. NS5B are used in the mixture. The method is used for assaying in vitro the activities of RdRp and TNTase encoded by HCV in order to identify, for therapeutic purposes, compounds that inhibit these enzymatic activities and therefore might interfere with the replication of the HCV. The present sequence comprises amino acids 810-3010 of the HCV polyprotein and corresponds to NS2-NS5B proteins. cDNA encoding this protein was cloned between the NcoI and HindIII sites of pBlueBacII to

CC form pBac25. Another expression plasmid, pBac5B (containing cDNA encoding
CC amino acids 2420-3010 of HCV; see AAW01679) was also constructed.
CC Extracts of Bac25- or Bac5B-infected Sf9 cells contain a novel magnesium-
CC dependent enzymatic activity that catalyses de novo RNA synthesis. This
CC activity was shown to be dependent on the presence of RNA, but
CC independent of an added primer or of the origin of the input RNA
CC molecule. As the products generated by extracts of Sf9 cells infected
CC with either Bac25 or Bac5 appeared to be identical, the experiments
CC indicated that the observed RdRp activity is encoded by the HCV NS5B
CC protein. (Updated on 25-MAR-2003 to correct PR field.) (Updated on 17-OCT
CC -2003 to standardise OS field)

XX New self-replicating RNA molecules from Hepatitis C virus (HCV), which
PT possess enhanced transduction or replication efficiency, useful for
PT evaluating potential inhibitors of HCV replication.

XX Claim 3; Page; 140pp; English.

XX The invention describes a self-replicating hepatitis C virus (HCV)
CC polynucleotide molecule comprising a 5'-non translated region (NTR),
CC where guanine at position 1 is substituted for adenine, a HCV polypeptide
CC region coding for a HCV polypeptide; and a 3'-NTR region. The self-
CC replicating Hepatitis C virus (HCV) RNA molecule is useful for evaluating
CC potential inhibitors of HCV replication. The HCV RNA molecule is also
CC useful for efficiently establishing cell culture replication. The self-
CC replicating polynucleotide molecule contains a 5'-NTR, where G at

CC position 1 is substituted for A, and therefore provides an alternative to
CC existing systems comprising a self-replicating HCV RNA molecule that, in
CC conjunction with mutations in the HCV non-structural region, such as the
CC G(2042)C/R mutations, transduces and/or replicates with greater
CC efficiency. This amino acid sequence represents a mutant of the hepatitis
CC C virus replicon APGK12 and contains the viral protease NS2/3, protease
CC complex NS3/4, helicase NS3 and RNA-dependent RNA polymerase NS5B. Note:
CC This sequence does not appear in the specification but has been created
CC from the wild type sequence shown in ABG30580 using information given in
CC the claims of the invention

XX possess enhanced transduction or replication efficiency, useful for
XX evaluating potential inhibitors of HCV replication.
XX PS Claim 3; Page; 140pp; English.

XX CC The invention describes a self-replicating hepatitis C virus (HCV)
XX polynucleotide molecule comprising a 5'-non translated region (NTR),
XX where guanine at position 1 is substituted for adenine, a HCV polypeptide
XX region coding for a HCV polypeptide; and a 3'-NTR region. The self-
XX replicating Hepatitis C virus (HCV) RNA molecule is useful for evaluating
XX potential inhibitors of HCV replication. The HCV RNA molecule is also
XX useful for efficiently establishing cell culture replication. The self-
XX replicating polynucleotide molecule contains a 5'-NTR, where G at
XX position 1 is substituted for A, and therefore provides an alternative to
XX existing systems comprising a self-replicating HCV RNA molecule that, in
XX conjunction with mutations in the HCV non-structural region, such as the
XX G(2042)C/R mutations, transduces and/or replicates with greater
XX efficiency. This amino acid sequence represents a mutant of the hepatitis

CC C virus replicon APGK12 and contains the viral protease NS2/3, protease
CC complex NS3/4, helicase NS3 and RNA-dependent RNA polymerase NS5B. Note:
CC This sequence does not appear in the specification but has been created
CC from the wild type sequence shown in ABG30580 using information given in
CC the claims of the invention

XX XX
XX PS Claim 3; Page; 140pp; English.
XX XX
XX CC The invention describes a self-replicating hepatitis C virus (HCV)
XX CC polynucleotide molecule comprising a 5'-non translated region (NTR),
XX CC where guanine at position 1 is substituted for adenine, a HCV polyprotein
XX CC region coding for a HCV polyprotein; and a 3'-NTR region. The self-
XX CC replicating Hepatitis C virus (HCV) RNA molecule is useful for evaluating
XX CC potential inhibitors of HCV replication. The HCV RNA molecule is also
XX CC useful for efficiently establishing cell culture replication. The self-
XX CC replicating polynucleotide molecule contains a 5'-NTR, where G at
XX CC position 1 is substituted for A, and therefore provides an alternative to
XX CC existing systems comprising a self-replicating HCV RNA molecule that, in
XX CC conjunction with mutations in the HCV non-structural region, such as the
XX CC G(2042)C/R mutations, transduces and/or replicates with greater
XX CC efficiency. This amino acid sequence represents a mutant of the hepatitis
XX CC C virus replicon APGK12 and contains the viral protease NS2/3, protease
XX CC complex NS3/4, helicase NS3 and RNA-dependent RNA polymerase NS5B. Note:
XX CC This sequence does not appear in the specification but has been created
XX CC from the wild type sequence shown in ABG30580 using information given in
XX CC the claims of the invention

 XX Claim 13; SEQ ID NO 211; 175pp; English.
 XX
 CC The invention relates to a novel method for modulating an immune response
 CC comprising administering to a subject an overlapping synthetic peptide
 CC formulation (OSPP) which comprises a combination of single chain peptides
 CC corresponding to the amino acid sequence of a protein of interest. The
 CC method of the invention has immunostimulant, virucide, antibacterial,
 CC antiparasitic and cytostatic applications and may be useful during
 CC vaccine production and for treating immune disorders including viral,
 CC bacterial and parasitic infections, prion diseases, neoplastic diseases,
 CC as well as providing protection against toxins. The current sequence is
 CC that of the OSPP-related Hepatitis C virus (HCV) polyprotein of the
 CC invention.

 XX Claim 39; Page 70-78; 153pp; English.
 XX
 CC The patent discloses a reporter gene system for use in a cell-based
 CC assessment of inhibitors of Hepatitis C virus (HCV) NS3 protease, using a
 CC recombinant viral vector (RVV), that expresses a secreted human placental
 CC alkaline phosphatase (SEAP) reporter gene polyprotein, under the control
 CC of bacteriophage T7 promoter. The viral vector has been engineered to
 CC express a polyprotein, that includes NS3 HCV serine protease and the
 CC human SEAP gene. This assay system is useful for in vitro screening of
 CC potential protease inhibitors useful in the treatment of HCV infections
 CC and used to evaluate potent NS3 inhibitors, by monitoring the effect of
 CC increasing drug concentration on SEAP activity. NS3 inhibition is
 CC detected as a decrease in SEAP activity. The present sequence is the
 CC recombinant fusion protein, encoded by the RVV pHCAP-1, comprising five
 CC segments and the active NS2 and NS3 protease polyprotein, fused with the
 CC SEAP reporter protein. The plasmid is constructed using the pTM3 vector
 CC and has been used to generate recombinant vaccinia viruses. (Updated on
 CC 12-SEP-2003 to standardise OS field)

DNA and polypeptide(s) from a new type of hepatitis C virus (KHCV) - for
 diagnosing and vaccinating against KHCV infections.

Disclosure; Fig 2; 119pp; English.

The polypeptide is that encoded by the full cDNA sequence of Korean
 hepatitis C virus (KHCV) cDNA, KHCV-LBC1. It or its fragments may be used
 in a specific and accurate method for detecting KHCV antibodies in the
 serum of hepatitis C patients. Antibodies directed against these
 polypeptides are useful for the purification of KHCV antigens and for the
 development of an improved diagnostic to detect KHCV antigens in a
 sample. The polypeptides may also be used in a vaccine for treatment and
 prevention of KHCV infection at a dosage of 5-200 ug/peptide. (Updated on
 25-MAR-2003 to correct PN field.) (Updated on 27-AUG-2003 to correct OS

XX New hepatitis virus polypeptides, useful for diagnosing and treating
FT hepatitis infections.
XX Claim 2; Fig 2(1)-(16); 56pp; English.
XX This sequence represents the non-A, non-B hepatitis virus (NANBV)
CC polypeptide, as predicted from cDNA (see AAX59394) containing the entire
CC open reading frame of the NANBV genome. To obtain this cDNA, NANBV RNAs
CC were extracted directly from NANBV particles contained in whole blood of
CC a patient having NANB hepatitis, or from a resected liver of a patient
CC having NANB hepatitis and liver cancer. The RNA was then converted to
CC double-stranded cDNA. A cDNA library was produced and screened using
CC serum from a convalescent patient having acute NANB hepatitis and serum
CC from a patient having chronic NANB hepatitis. The isolated cDNA allows
CC recombinant production of NANBV antigen polypeptides in microbial or
CC eukaryotic cell culture. The method provides the safe production of NANBV
CC antigens with high purity on a large scale at low cost without the
CC biohazard associated with multiplying virus in animals. Claimed NANBV
CC nucleotide sequences are useful for the recombinant production of
CC polypeptides useful as antigens for vaccines, and as diagnostic reagents.

This sequence represents the non-A, non-B hepatitis virus (NANBV)
polypeptide, as predicted from cDNA (see AAX59394) containing the entire
open reading frame of the NANBV genome. To obtain this cDNA, NANBV RNAs
were extracted directly from NANBV particles contained in whole blood of
a patient having NANB hepatitis, or from a resected liver of a patient
having NANB hepatitis and liver cancer. The RNA was then converted to
double-stranded cDNA. A cDNA library was produced and screened using
serum from a convalescent patient having acute NANB hepatitis and serum
from a patient having chronic NANB hepatitis. The isolated cDNA allows
recombinant production of NANBV antigen polypeptides in microbial or
eukaryotic cell culture. The method provides the safe production of NANBV
antigens with high purity on a large scale at low cost without the
biohazard associated with multiplying virus in animals. Claimed NANBV
nucleotide sequences are useful for the recombinant production of
polypeptides useful as antigens for vaccines, and as diagnostic reagents.

XX New isolated hepatitis C virus nucleic acids - used to develop products
XX for the diagnosis, prevention and treatment of HCV infections and for
XX developing screening assays.
XX Claim 2; Fig 14G-H; 126pp; English.
XX This protein is encoded by the infectious hepatitis C virus (HCV)
XX genotype 1b strain HC-J4 genome (see AAX24843). HC-J4 was obtained from
XX acute phase plasma of a chimpanzee infected with serum containing HC-
XX J4/91. The infectious nucleic acid sequence can be used to produce
XX chimeric genomes (see AAX24833) consisting of the open reading frames of
XX infectious nucleic acid sequences of other genotypes (including genotypes
XX 1-6) and subtypes (such as 1b, 2a, 2b, 2c, 3a, 4a-f, 5a and 6a) of HCV.
XX The invention also relates to the introduction of mutations or deletions
XX into infectious nucleic acid sequences in order to produce an attenuated
XX HCV virus suitable for vaccine development. Infectious nucleic acid
XX sequences can also be used to produce attenuated virus via passage in
XX vitro or in vivo of the viruses produced by transfection of a host cell
XX with the infectious nucleic acid sequence. Vaccines comprising one or
XX more polypeptides made from the infectious nucleic acid sequence are used
XX to immunise mammals, especially humans, against hepatitis C. The nucleic
XX acid sequences can also be used to induce protective immunity against the
XX virus. The nucleic acid sequences or their encoded proteases (e.g. NS3
XX protease) can additionally be used to develop screening assays to
XX identify antiviral agents for HCV

PT New nucleic acid comprising a chimeric bovine viral diarrhoea virus genome
 PT in which the (non-)structural region has been replaced by hepatitis C
 PT virus (HCV) genome useful for treating or preventing HCV signs and
 XX symptoms.
 XX Disclosure; Fig 4G-H; 97pp; English.
 PS The specification describes a nucleic acid comprising a chimeric virus
 CC genome, specifically bovine viral diarrhoea virus (BVDV) genome in which
 CC the (non-)structural region has been replaced by the (non-)structural
 CC region of a hepatitis C virus (HCV) genome. The nucleic acids comprising
 CC the chimeric virus and the chimeric virus are useful for identifying cell
 CC lines capable of supporting the replication of these chimeric viruses, in
 CC screening for neutralizing antibodies to HCV of different genotypes, in
 CC the production of HCV-BVDV virions, for the development of inactivated or
 CC attenuated vaccines to prevent HCV-BVDV in a mammal, in studying the
 CC molecular properties of HCV indirectly in vitro, and in identifying
 CC inhibitors of viral enzyme activity which would be useful as antiviral
 CC agents. Formulations or compositions comprising the chimeric virions may
 CC be used to treat or prevent the signs and symptoms of HCV. The present
 CC sequence is encoded by a HCV clone, which is used to construct chimeric
 CC nucleic acids of the invention

 XX
 XX The invention relates to nucleic acid molecules comprising altered HCV
 CC NS3 or HCV NS5 encoding region, or encephalomyocarditis virus (EMCV)
 CC internal ribosome entry site (IRES) region coding for one or more NS3,
 CC NS5A, or EMCV IRES mutations, respectively. The location of the mutations
 CC are detailed in the specification. Also included are (1) an expression
 CC vector comprising a nucleotide sequence coding for the altered nucleic
 CC acids, which is transcriptionally coupled to an exogenous promoter; (2) a
 CC recombinant cell human hepatoma cell comprising the altered nucleic acids
 CC ; (3) a recombinant cell produced by introducing into a human hepatoma
 CC cell the altered nucleic acids; (4) producing an HCV (hepatitis C virus)
 CC replicon enhanced cell or which containing a functional HCV replicon; (5)
 CC an HCV replicon enhanced cells made in the method; and (6) measuring the
 CC ability of a compound to affect HCV activity. The HCV replicons and HCV
 CC replicon enhanced cells are useful in studying HCV replication and
 CC expression, and HCV and host cell interactions, producing HCV RNA and
 CC proteins, and providing a system for measuring the ability of a compound
 CC to modulate one or more HCV activities e.g. to discover drugs which may
 CC treat HCV mediated diseases such as liver failure, cirrhosis and
 CC hepatocellular carcinoma. The present sequence is the HCV replicon Con 1
 CC polypeptide (comprising the Core, E1, E2, P7, NS2, NS3, NS4A, NS4B, NS5A

XX PT Diagnosing liver cancer, involves amplifying amino terminal region of hepatitis-C virus gene using predetermined primer and determining hepatitis-C virus in base sequence of obtained DNA fragment.
XX PS Disclosure; SEQ ID NO 6; 36pp; Japanese.
XX CC The invention relates to the novel testing method for diagnosing liver cancer. The novel method comprises amplifying the amino terminal region of a hepatitis-C virus NS3 gene using a predetermined primer and determining the hepatitis-C virus in a base sequence of the obtained DNA fragment. The novel testing method is useful for diagnosing liver cancer and also used in a gene amplification technique, a clinical laboratory test reagent, a polymerase chain reaction, a base sequence analysis and genetic engineering. The method enables the detection of a hepatitis-C virus having high carcinogenicity with high specificity. This sequence represents the protein of the hepatitis-C virus NS3 gene of the invention.

New Hepatitis C virus (HCV) vaccine having a polynucleotide that encodes the polypeptide sequences of the HCV core and at least one other HCV protein, for use in medicine, particularly for manufacturing a medicament for treating HCV.
Disclosure; Fig 6; 78pp; English.
The invention describes a polynucleotide vaccine comprising a polynucleotide sequence (SI) encoding the Hepatitis C virus (HCV) Core protein and at least 1 other HCV protein, and causes expression of the proteins in cells (in which (SI) has been mutated or positioned relative to the polynucleotide sequence encoding the other HCV protein, so that the negative effect of the Core protein on expression of the other HCV protein is reduced). Also described are: a method of preventing or treating an HCV infection in a mammal, comprising administering the vaccine cited above to a mammal; and a method of vaccination of an individual, comprising taking a polynucleotide vaccine as cited above, coating the polynucleotide onto gold beads and delivering the gold beads into the skin. HCV nucleic acids, polypeptides, host cells, vectors and antibodies used in the methods, are also disclosed. The polynucleotide vaccine is useful in the manufacture of a medicament for the treatment of HCV. This is the amino acid sequence of the wild type HCV polyprotein.

XX
XX New Hepatitis C virus (HCV) vaccine having a polynucleotide that encodes
PT the polypeptide sequences of the HCV core, NS3, NS4B and NS5B proteins,
PT for use in medicine, in particular for manufacturing a medicament for the
PT treatment of HCV.
XX
XX Disclosure; Fig 6; 79pp; English.
XX
XX The present sequence is the hepatitis C virus (HCV) J4L6 genome wild-type
CC polypeptide sequence. HCV DNA vaccines of the invention comprise a
CC polynucleotide that encodes the HCV proteins Core, NS3, NS4B and NS5B,
CC and does not encode the NS4A and/or NS5A proteins. Preferably, the codon
CC usage of the polynucleotide sequence resembles that of highly expressed
CC human genes. The polynucleotides may encode individual proteins or fusion
CC proteins. Preferred fusions include double fusions between NS4B and NS5B
CC and between Core and NS3. The vaccines are useful for the treatment or
CC prevention of an HCV infection.

XX
XX The invention relates to a method of identifying a candidate peptide
CC epitope which induces an HLA class I CTL response against variants of the
CC peptide epitope, comprising identifying, from a particular antigen of an
CC infectious agent, variants of a peptide epitope comprising primary anchor
CC residues of the same HLA class I binding motif. The method is useful for
CC identifying a candidate peptide epitope, which induces an HLA class I CTL
CC response against variants of the peptide epitope. This sequence
CC represents an HCV polymerase protein used in the scope of the invention.

XX
XX New Hepatitis C virus (HCV) replicons comprising altered HCV NS3 or HCV NS5 encoding region, or encephalomyocarditis virus (EMCV) internal ribosome entry site (IRES) region, useful in studying HCV replication and expression.
XX
XX Claim 1; Page; 69pp; English.
XX
XX The invention relates to nucleic acid molecules comprising altered HCV NS3 or HCV NS5 encoding region, or encephalomyocarditis virus (EMCV) internal ribosome entry site (IRES) region coding for one or more NS3, NS5A, or EMCV IRES mutations, respectively. The location of the mutations are detailed in the specification. Also included are (1) an expression vector comprising a nucleotide sequence coding for the altered nucleic acids, which is transcriptionally coupled to an exogenous promoter; (2) a recombinant cell human hepatoma cell comprising the altered nucleic acids; (3) a recombinant cell produced by introducing into a human hepatoma cell the altered nucleic acids; (4) producing an HCV (hepatitis C virus) replicon enhanced cell or which containing a functional HCV replicon; (5) an HCV replicon enhanced cells made in the method; and (6) measuring the ability of a compound to affect HCV activity. The HCV replicons and HCV replicon enhanced cells are useful in studying HCV replication and expression, and HCV and host cell interactions, producing HCV RNA and proteins, and providing a system for measuring the ability of a compound to modulate one or more HCV activities e.g. to discover drugs which may treat HCV mediated diseases such as liver failure, cirrhosis and hepatocellular carcinoma. The present sequence is the HCV replicon Con 1 polyprotein (comprising the Core, E1, E2, P7, NS2, NS3, NS4A, NS4B, NS5A and NS5B proteins), NS5A mutant of the invention. Note: The present sequence is not shown in the specification but was created by the indexer using the HCV sequence appearing as ABG32451 and the information in claim 1

XX Identifying a compound that inhibits replication of a hepatitis C virus
PT (HCV) RNA comprises contacting a cell comprising a replication competent
PT HCV RNA containing a heterologous polynucleotide encoding a
PT transactivator, with a compound.

XX Disclosure; Fig 24; 95pp; English.
PS

XX The invention describes a method of identifying a compound that inhibits
CC replication of a hepatitis C virus (HCV) RNA. The method comprises
CC contacting a cell comprising a replication competent HCV RNA containing a
CC heterologous polynucleotide having a first coding sequence encoding a
CC transactivator, with a compound. The method is useful for identifying a
CC compound that inhibits replication of HCV RNA. The kit is useful for
CC detecting replication competent HCV RNA. This sequence represents the
CC internal ribosome entry site (IRES) of Encephalomyocarditis virus (EMCV)
CC used in the creation of a modified HCV cDNA.

XX
XX Improving properties of peptides for use as diagnostic antigens or for
PT preventing or treating infections.
PT
XX Claim 55; Page 73; 83pp; English.
PS
XX This is a peptide related to the immunoreactive region of the NS4 region
CC of hepatitis C virus (HCV). The peptide is useful for detecting HCV
CC infection. The invention relates to peptides derived from HCV and also
CC HIV-1 which have been modified for use as diagnostic antigens in the
CC treatment or prevention of infection. The structural stability of the
CC peptides can be increased in four different ways; through the replacement
CC of a hydrophobic amino acid with a less hydrophobic amino acid; through
CC an increase in the amount of secondary structure (i.e. alpha helix) in
CC the peptide; through the removal of a positive charge from the peptide,
CC or through the constraint of the epitopic sequence via the formation of a
CC

covalent crosslink. Modified peptides of the invention are used to detect infectious agents specifically HCV. Other detectable agents include HIV-1 Group O viruses; human T-cell lymphotropic virus-I or -II; and the causative agent of syphilis. The peptides can be used for prevention or treatment of infections (e.g. as vaccines, or where expressed from a transgene). More generally almost any peptide can be similarly modified, e.g. cytokines or interferons; major histocompatibility complex antigens; hormones; growth factors; tumour markers or suppressors, or antigens from many other pathogens

XX

Novel nucleic acid construct useful for detecting the presence of RNA virus, comprises an expression cassette and a promoter operably linked to expression cassette for minus strand RNA transcription of the cassette.

XX Example 1; Page 70-81; 81pp; English.

XX

The invention relates to nucleic acid construct which comprises an expression cassette including a first polynucleotide region including a 5' non-coding region (NCR) sequence of an RNA virus and at least an N-terminal portion of a coding sequence of RNA virus, a second polynucleotide region including a 3' untranslated region (UTR) sequence of the RNA virus and at least a C-terminal portion of a coding sequence of the RNA virus and a third polynucleotide region encoding a reporter molecule, flanked by first and second polynucleotide regions; and a promoter sequence being operatively linked to expression cassette in a manner so as to enable a transcription of a minus strand RNA molecule from the expression cassette. Nucleic acid construct of the invention is useful for detecting the presence of an RNA virus in a cell. It is also useful for screening anti-viral drugs and determining drug resistance of an RNA virus. The present sequence is Hepatitis C virus (HCV) isolate HCV

PT Identifying a candidate peptide epitope, which induces a HLA class I CTL

response comprises identifying variants of a peptide epitope 8-11 amino

acids in length comprising primary anchor residues of the same HLA class

I binding motif.

XX

PS Disclosure; Page 388-440; 458pp; English.

XX

CC The invention relates to a method of identifying a candidate peptide

epitope which induces an HLA class I CTL response against variants of the

peptide epitope, comprising identifying, from a particular antigen of an

infectious agent, variants of a peptide epitope comprising primary anchor

residues of the same HLA class I binding motif. The method is useful for

identifying a candidate peptide epitope, which induces an HLA class I CTL

response against variants of the peptide epitope. This sequence

represents an HCV polymerase protein used in the scope of the invention.

CC binding selected major histocompatibility complex (MHC) molecules and
 CC inducing an immune response. The pharmaceutical compositions are useful
 CC for the treatment of human viral diseases (e.g. prostate cancer,
 CC hepatitis B, hepatitis C, AIDS, renal carcinoma, cervical carcinoma,
 CC lymphoma, cytomegalovirus and condyloma acuminatum), cancers or
 CC autoimmune diseases, and to relieve the symptoms of, treat or prevent the
 CC occurrence or reoccurrence of autoimmune diseases e.g. multiple sclerosis
 CC (MS), rheumatoid arthritis, Sjogren syndrome, scleroderma, polymyositis,
 CC dermatomyositis, systemic lupus erythematosus, juvenile rheumatoid
 CC arthritis, ankylosing spondylitis, myasthenia gravis, bullous pemphigoid,
 CC pemphigus, glomerulonephritis, Goodpasture's syndrome, autoimmune
 CC haemolytic anaemia, Hashimoto's disease, pernicious anaemia, idiopathic
 CC thrombocytopenic purpura, Grave's disease, and Addison's disease. The
 CC compositions are capable of specifically binding glycoproteins encoded by
 CC HLA-A2.1 allele and inducing T cell activation in T cells restricted by
 CC the A2.1 allele. This is the amino acid sequence of a HLA-A2.1 binding
 CC peptide.

 XX PT New composition comprising at least one peptide having allele-specific
 XX PT binding motifs for HLA, useful for preventing, treating or diagnosing
 XX PT viral diseases and cancer.
 XX PF Claim 1; Page 52-379; 382pp; English.
 XX CC The invention relates to a composition comprising at least one peptide
 CC having an isolated, prepared epitope selected from any of the sequences
 CC from 30 lists given in the specification. Also disclosed is a method for
 CC inducing a cytotoxic T cell response against a pre-selected antigen in a
 CC patient expressing a specific MHC class I allele by contacting cytotoxic
 CC T cells from the patient with the composition cited above. The
 CC composition comprises an epitope that is joined by an amino acid linker.
 CC The epitope is admixed or joined to a CTL or HTL epitope. The epitope is
 CC bound to an HLA molecule on the antigen-presenting cell, where when an A2
 CC -restricted cytotoxic lymphocyte (CTL) is present, a receptor of the CTL
 CC binds to a complex of the HLA molecule and the epitope. Specifically
 CC claimed are peptides having allele-specific binding motifs for HLA. The
 CC compositions and methods are useful for preventing, treating or
 CC diagnosing viral diseases and cancer. The peptide epitopes are useful as
 CC diagnostic agents for evaluating immune responses, for making antibodies
 CC and for evaluating efficacy of a vaccine. Sequences given in ADM29251-
 CC ADM37745 represent epitopes of the invention as given in Tables 2-31.

 Use of at least one set of peptides in the preparation of a medicament
 for modulating an immune response, and for treating cancer or yeast,
 viral, bacterial, protozoal and mycoplasma infections.
 Disclosure; SEQ ID NO 1421; 645pp; English.
 The invention relates to the use of at least one set of peptides in the
 preparation of a medicament for modulating an immune response, where
 individual peptides of a respective set comprise different portions of an
 amino acid sequence corresponding to a single polypeptide of interest and
 display partial sequence identity or similarity to at least one other
 peptide of the same set of peptides (i.e. they are overlapping). Also
 included are an antigen-presenting cell which has been contacted with the
 peptides above and thus presents the peptides, a population of such
 antigen-presenting cells, a process for producing antigen-presenting
 cells for modulating an immune response to a polypeptide of interest, a
 method for producing antigen-specific lymphocytes, a composition
 comprising at least one set of the peptides (and a carrier and/or
 diluent), a method for modulating an immune response to a polypeptide of
 interest comprising administering to a patient in need at least one set
 of the peptides, a method for treatment and/or prophylaxis of a disease
 or condition associated with the presence of a polypeptide of interest
 and a composition of matter for modulating an immune response in a
 subject to a target antigen. The polypeptide of interest is also a
 disease- or condition-associated polypeptide that is a polypeptide
 produced by a pathogenic organism or a cancer, and produced by a
 pathogenic organism selected from yeast, viruses, bacteria, helminths,
 protozoans and mycoplasmas. The disease- or condition-associated
 polypeptide is produced by a cancer selected from melanoma, lung cancer,
 breast cancer, cervical cancer, prostate cancer, colon cancer, pancreatic
 cancer, stomach cancer, bladder cancer, kidney cancer, post transplant
 lymphoproliferative disease (PTLD) or Hodgkin's lymphoma. The uncultured
 antigen-presenting cells or their precursors are useful in the
 preparation of a medicament for the treatment of a disease or condition
 in a subject, which disease or condition is associated with the presence
 of aberrant expression of a target antigen, where the antigen-presenting
 cells or their precursors have not been subjected to activating
 conditions but have been contacted with an antigen that corresponds to
 the target antigen to express a processed or modified form of the antigen
 for presentation to the subject's immune system. The present sequence is
 one of a set of overlapping immunogenic peptides derived from a Hepatitis
 C virus protein.

XX PR Non-A, non-B hepatitis-specific antigen polypeptide - for detection of
PT hepatitis virus gene or antibody directed against the virus.
XX PS Disclosure; Fig 8; 78pp; English.
XX CC The amino acid sequence is that of a non-A non-B (NANB) hepatitis
CC specific antigen polypeptide, which may be recombinantly produced. It is
CC encoded by a fragment of DNA clone Cl0-18. It can be used to prepare
CC antibodies which can be used to detect NANB hepatitis with extremely high
CC accuracy. It can also be used to detect anti-NANB hepatitis antibodies.
CC See also AAR20609-R20615 and AAR20714-R20723. (Updated on 27-AUG-2003 to
CC correct OS field.)

XX New immunogenic peptides with HLA binding motif, useful in treatment and
PT diagnosis of cancers and viral diseases.
XX PS Claim 1; Page 87; 150pp; English.
XX CC AA45390 to AA48214 represent specifically claimed immunogenic peptides
CC having a human major histocompatibility complex (MHC) Class I (also known
CC as human leukocyte antigen (HLA)) binding motif. The immunogenic peptides
CC can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A1, A3.2
CC or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against
CC the antigen from which the peptide is derived. Cytotoxic T lymphocytes
CC (CTLs) which destroy antigen-bearing cells are normally induced by an
CC antigen in the form of a peptide fragment bound to a HLA molecule, rather
CC than the intact foreign antigen itself, and are particularly important in
CC tumour rejection and in fighting viral infections. The peptides are
CC therefore useful therapeutically to treat or prevent viral infections and
CC cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B
CC and C, AIDS, and renal carcinoma. They can be administered as vaccines to
CC elicit an immune response in individuals susceptible or otherwise at risk
CC of viral infection or cancer, or used to treat chronic or acute
CC conditions. They are also useful diagnostically, and can be used to
CC induce a cytotoxic T cell response, by contacting a cytotoxic T cell with
CC the peptide e.g. to produce CTLs ex vivo for infusion back into a
CC patient. The polynucleotides encoding the immunogenic peptides are also
CC useful therapeutically and for immunisation as above

XX New selected interacting domain polypeptides and polynucleotides, useful

PT for treating or preventing infections or pathologies caused by hepatitis

PT C virus (HCV) or those linked to HCV infection.

XX Claim 26; SEQ ID NO 92; 61pp + Sequence Listing; English.

XX The invention relates to nucleic acids encoding polypeptides which are

CC termed SID polypeptides (selected interacting domain). These polypeptides

CC are the final products of a double selection method involving a first

CC step of selection of Hepatitis C virus (HCV)-derived polynucleotides

CC through a two-hybrid system, and a second selection step involving an

CC alignment between the different polynucleotides selected at the first

CC step. The activity of polypeptides of the invention may be described as,

CC virucide, hepatotropic, antiinflammatory and antibacterial. The

CC polypeptide, polynucleotide and compositions comprising them are useful

CC for treating or preventing viral or a bacterial infection, specifically

CC infections or pathologies caused by HCV or those pathologies linked to

CC HCV infection. These may include liver disease and liver cancer. The

CC current sequence represents a HCV bait polypeptide. Note: The sequence

CC data for this patent is not represented in the specification, but is

CC based on sequence information supplied by the European Patent Office

XX New hepatitis C virus epitopes which are specific for CD40-positive T

PT lymphocytes, useful for diagnosis and vaccination of hepatitis C virus

PT infection.

XX Claim 3; Page 14; 34pp; German.

XX The present invention relates to Hepatitis C virus (HCV) epitopes that

CC are specific for CD4+ T-lymphocytes and their derivatives with comparable

CC specificity. HCV epitopes of the invention are useful for diagnosis of

CC HCV infection (by determining the level of CD4+ cells specific for a

CC particular epitope) and particularly when formulated as a vaccine, for

CC treatment and prevention of infection. DNAs that encode HCV epitopes can

CC also be used in vaccines. The present sequence is a HCV epitope derived

CC peptide

 XX Improving properties of peptides for use as diagnostic antigens or for
 PT preventing or treating infections.
 XX Claim 55; Page 73; 83pp; English.
 XX This is a peptide related to the immunoreactive region of the NS4 region
 CC of hepatitis C virus (HCV). The peptide is useful for detecting HCV
 CC infection. The invention relates to peptides derived from HCV and also
 CC HIV-1 which have been modified for use as diagnostic antigens in the
 CC treatment or prevention of infection. The structural stability of the
 CC peptides can be increased in four different ways; through the replacement
 CC of a hydrophobic amino acid with a less hydrophobic amino acid; through
 CC an increase in the amount of secondary structure (i.e. alpha helix) in
 CC the peptide; through the removal of a positive charge from the peptide,
 CC or through the constraint of the epitopic sequence via the formation of a
 CC covalent crosslink. Modified peptides of the invention are used to detect
 CC infectious agents specifically HCV. Other detectable agents include HIV-1
 CC Group O viruses; human T-cell lymphotropic virus-I or -II; and the
 CC causative agent of syphilis. The peptides can be used for prevention or
 CC treatment of infections (e.g. as vaccines, or where expressed from a
 CC transgene). More generally almost any peptide can be similarly modified,
 CC e.g. cytokines or interferons; major histocompatibility complex antigens;
 CC hormones; growth factors; tumour markers or suppressors, or antigens from
 CC many other pathogens

XX New polynucleotide sequences from hepatitis C virus - and related
 PT vectors, polypeptide(s) and antibodies, useful for immunisation,
 PT treatment, diagnosis and typing of HCV isolates.

XX Disclosure; Page 250-252; 404pp; English.

XX Compositions comprising at least 5, and pref. 8 or more contiguous
 CC nucleotides selected from an HCV type 3 genomic sequence, more
 CC particularly (i) the region spanning positions 417-957 of the Core/E1
 CC region of HCV subtype 3a; (ii) the region spanning positions 4664-4730 of
 CC the NS3 region of HCV type 3; (iii) the region spanning positions 4892-
 CC 5292 of the NS3/4 region of HCV type 3; (iv) the region spanning
 CC positions 8023-8235 of the NS5 region of the BR36 subgroup of HCV subtype
 CC 3a; or (v) an HCV subtype 3c genomic sequence, may be used as primers to
 CC amplify nucleic acid from an isolate belonging to a specific genotype, or
 CC as a probe for specific detection/classification of nucleic acid.
 CC Polypeptides encoded by the nucleotides in such compositions may be used
 CC for immunisation against HCV, for the detection of antibodies directed
 CC against HCV and for serotyping. This sequence corresponds to the NS3/5B
 CC region of HCV. (Updated on 25-MAR-2003 to correct PN field.)

XX Detergent-free hepatitis C virus protease NS3 - useful for screening for
 PT specific inhibitors and for diagnosing infection, is more active and
 PT stable than known enzyme preparations.

XX Disclosure; Page 14-16; 24pp; English.

XX The present sequence represents the nonstructural protein 3 (NS3) of
 CC Hepatitis C virus (HCV). The present protein is a stable, detergent-free
 CC NS3 protease. The specification describes a screening assay for compounds
 CC that inhibit NS3. The assay comprises incubating NS3 with the test
 CC compound and detecting any inhibition of protease activity that occurs.
 CC NS3 can be used to screen for inhibitory compounds and for diagnosis of
 CC HCV infection

XX
XX Claim 6; Page 16-18; 26pp; English.
XX
XX This sequence represents the Hepatitis C virus (HCV) NS3 serine protease
CC domain. The NS3 serine protease domain requires NS4A (see AAR82855) as a
CC cofactor. Optimal serine protease activity is obtained when NS4A and NS3
CC are present in a 1:1 ratio. The cleavage site between these two proteins
CC on the HCV genome can be mutated so that the components remain covalently
CC bonded. These sequences are included in a composition that can be used in
CC an assay system. This assay system can be used to select compounds that
CC inhibit NS3 activity, e.g. potential therapeutic agents. NS4A can be used
CC for screening enzyme inhibitors. (Updated on 25-MAR-2003 to correct PR
CC field.)

FT for diagnosis of HCV infection.
XX
XX Claim 2; Page 14-17; 22pp; Japanese.
XX
XX This sequence represents the NS3 region of the hepatitis C virus (HCV)
CC serine protease. The fragment of this sequence represented in AAW26159 is
CC recognised by the monoclonal antibody of the invention. The monoclonal
CC antibody belongs to the IgG class of antibodies. The antibody is produced
CC by fusion cells formed between immunocytes from a HCV infected mammal,
CC and myeloma cells from the same mammal. The antibody is used for
CC diagnosis of HCV infection. As this monoclonal antibody can bind to a
CC certain chain in serine protease and inhibits the enzyme specifically, it
CC can also be used as an agent for neutralising the activity of serine
CC protease

 XX New chimeric protein, useful for detecting protease inhibitors inside the
 PT cell or tissue.
 PT
 XX
 XX Disclosure; SEQ ID NO 78; 214pp; English.

XX The present invention describes a chimeric protein comprising at least
 CC one signal protein that has a trafficking signal targeting to a
 CC subcellular organelle and at least one proteolytic cleavage site for a
 CC protease. The chimeric protein is constructed, so that: (a) the
 CC trafficking signals of all the signal proteins are inactivated by linking
 CC the proteolytic site or a signal masking protein through the proteolytic
 CC site to the N- or C- terminus of the signal proteins, and so the chimeric
 CC protein is present in cytosol; (b) the trafficking signal of at least one
 CC signal protein is activated when the proteolytic cleavage site is cleaved
 CC by the protease, and as a result at least one fragment protein that
 CC includes the activated signal protein is transported to a subcellular
 CC organelle; and (c) the chimeric protein is labelled with at least one
 CC fluorescent protein and the position and intensity distribution of the
 CC fluorescent label signal in the cell is altered depending on the cleavage
 CC by the protease. Also described: (1) a recombinant gene comprising a
 CC nucleic acid sequence encoding the chimeric protein which is constructed
 CC to express the chimeric protein in a cell; (2) a cell transformed with
 CC the recombinant gene or vector; (3) analysing the activity of a protease
 CC in vivo; (4) screening protease inhibitors in vivo; (5) a system for
 CC detecting a protease inside a cell; (6) a nucleic acid comprising the
 CC sequence encoding the chimeric protein for detecting protease activity in
 CC a cell; (7) a vector comprising the nucleic acid; (8) a kit for detecting
 CC a protease inside a cell comprising the chimeric protein or the vector;
 CC (9) detecting a protease inside a cell or tissue; and (10) detecting a
 CC protease inhibitor in vivo. The chimeric protein is useful for detecting
 CC protease inhibitors inside the cell or tissue. The present sequence
 CC represents HCV NS3 protease, which is used in the exemplification of the
 CC present invention.

 PT New Hepatitis C virus (HCV) vaccine having a polynucleotide that encodes
 PT the polypeptide sequences of the HCV core, NS3, NS4B and NS5B proteins,
 PT for use in medicine, in particular for manufacturing a medicament for the
 PT treatment of HCV.
 XX
 XX
 PS Example 2; Page 26-27; 79pp; English.
 CC The present sequence is that of the NS3 protein of hepatitis C virus
 CC (HCV). The sequence is the translation sequence of a polynucleotide in
 CC which codon usage was altered to resemble that of highly expressed human
 CC genes. HCV vaccines of the invention comprise a polynucleotide that
 CC encodes the HCV proteins Core, NS3, NS4B and NS5B, and does not encode
 CC the NS4A and/or NS5A proteins. The proteins may be expressed as
 CC individual proteins or as fusion proteins. Preferred fusions include
 CC double fusions between NS4B and NS5B and between Core and NS3. The
 CC vaccines are useful for the treatment or prevention of an HCV infection.

XX New hepatitis C virus covalent complexes.

XX Claim 6; Page 83-85; 21pp; English.

XX The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A peptide, a linker, and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available

 New T-cell epitope, used as diagnostic tools and as vaccines/composition
 for the treatment and prevention of hepatitis C.
 Claim 1; SEQ ID NO 38; 122pp; English.
 The invention relates to a novel cytotoxic Hepatitis C virus (HCV) T-cell
 epitope, comprising any of the 429 fully defined amino acid sequences, or
 their variations, given in the specification. The invention further
 comprises: a method for predicting peptides that can be used as epitopes
 or as diagnostic tools; a prediction of the neural network combined with
 a prediction or measurement of one of the following: proteasomal cleavage
 sites, MHC binding, presence of sequence or related sequence(s) in patent
 databases, TAP binding, gene or protein expression level, function of the
 protein, or similarity of self proteins; and a vaccine and a diagnostic
 tool, each using a limited number such as at least 1-5, 8, 16, 32, 64,
 128, 256, or 512 of any of the peptides stated above or any of the
 peptides predicted using the method above. The cytotoxic HCV T-cell
 epitopes have antiinflammatory, virucide, and hepatotropic activities.
 The epitopes are useful as vaccines and as diagnostic tools. The vaccines
 and compositions are useful for treating and preventing hepatitis C virus
 infection. This sequence represents one of the 429 cytotoxic Hepatitis C
 virus T-cell epitopes of the invention.

 XX PT New fluorogenic compositions - containing 2 fluorophores separated by a
 PT peptide comprising a protease binding site, used for detecting protease
 PT activity in samples.

XX PS Claim 4; Page 77; 90pp; English.

XX CC AAW82023-W82240 are peptides used in the construction of a fluorogenic

CC composition which is used for the detection of protease activity in

CC biological samples. The products can be used for the detection of

CC conformation changes in nucleic acids, oligosaccharides, polysaccharides,

CC proteins, peptides, lipids, phospholipids, glycolipids, glycoproteins,

CC steroids or polymers. In addition, attachment of a hydrophobic group to a

CC molecule can be used to enhance uptake by cells. The composition is

CC composed of P = peptide comprising a protease binding site for the

CC protease, F1, F2 peptides = fluorophores where F1 is attached to the

CC amino terminal amino acid and F2 is attached to the carboxyl terminal

CC amino acid and S1, S2 peptides = when present, are peptide spacers where

CC S1, when present, is attached to the amino terminal acid, and S2, when

CC present, is attached to the carboxyl terminal amino acid

XX Indicator composition comprising polypeptide or nucleic acid backbone
XX joining two same chromophores resulting in quenching of fluorescence
XX of/change in absorbance of chromophores, useful for detecting protease
XX activity.
XX Disclosure; Page 33; 97pp; English.
XX This invention describes a novel indicator composition (referred as homo-
XX doubly labeled compositions) comprising a polypeptide backbone or a
XX nucleic acid backbone joining two chromophores of the same species
XX whereby the chromophores form an H-dimer resulting in quenching of the
XX fluorescence of or a change in the absorbance of the chromophore, a
XX decrease in fluorescence or a change in absorbance indicates that the
XX first molecule and the second molecule are interacting. The indicator is
XX useful for detecting the activity of a protease, where an increase in
XX fluorescence or a change in absorbance indicates that the protease
XX cleaves the polypeptide backbone. The indicator is attached to a solid
XX support inside a mammalian, yeast or insect cell. The composition bears a
XX hydrophobic group such as Fmoc, 9-fluorenesulfonyl group, 1-
XX fluorinecarboxylic group, 9-fluoreneacetyl group, and 9-fluorenone-1-
XX carboxylic group, benzoyloxycarbonyl, Xanthyl (Xan), Trityl (Trt), 4-
XX methyltrityl (Mt), 4-methoxytrityl (Mmt), 4-methoxy-2,3,6-trimethyl-
XX benzenesulfonyl (Mtr), Mesitylene-2-sulfonyl (Mts), 4,4'-
XX dimethoxybenzhydryl (Mbh), etc. The method described in the invention is
XX useful for detecting protease or nuclease activity (or the presence of
XX nucleic acid) in histological section, cells in culture, (e.g., seeded or
XX cultured adherent cells), a biological sample such as tissue, biopsy,
XX lymph, embryo, or whole animal, or cell suspension derived from a
XX biological sample such as tissue, blood, urine, saliva, lymph, or biopsy.
XX The indicator composition is also useful for screening a test agent for
XX the ability to modulate a protease (or a nuclease, lipase, etc.). The
XX indicator reagents allow rapid determination of protease activity in a
XX matter of minutes in a single-step procedure. The fluorescent indicators
XX both absorb and emit in the visible range (400-800 nm). These signals are
XX therefore not readily quenched by, nor is activation of the fluorophores,
XX that is, absorption of light, interfered with by background molecules;
XX therefore they are easily detected in biological samples. The fluorogenic
XX protease indicators utilize high efficiency fluorophores and are able to
XX achieve a high degree of quenching while providing a strong signal when
XX the quench is released by cleavage of the peptide substrate. The high
XX signal allows detection of very low levels of protease activity. Thus the
XX fluorogenic protease indicators are particularly well suited for in situ
XX detection of protease activity. ABU60357-ABU60477 represent peptides use
XX to illustrate the method described in the disclosure of the invention

XX
PS Disclosure; SEQ ID NO 1417; 645pp; English.
XX
CC The invention relates to the use of at least one set of peptides in the
CC preparation of a medicament for modulating an immune response, where
CC individual peptides of a respective set comprise different portions of an
CC amino acid sequence corresponding to a single polypeptide of interest and
CC display partial sequence identity or similarity to at least one other
CC peptide of the same set of peptides (i.e. they are overlapping). Also
CC included are an antigen-presenting cell which has been contacted with the
CC peptides above and thus presents the peptides, a population of such
CC antigen-presenting cells, a process for producing antigen-presenting
CC cells for modulating an immune response to a polypeptide of interest, a
CC method for producing antigen-specific lymphocytes, a composition
CC comprising at least one set of the peptides (and a carrier and/or
CC diluent), a method for modulating an immune response to a polypeptide of
CC interest comprising administering to a patient in need at least one set
CC of the peptides, a method for treatment and/or prophylaxis of a disease
CC or condition associated with the presence of a polypeptide of interest
CC and a composition of matter for modulating an immune response in a
CC subject to a target antigen. The polypeptide of interest is also a
CC disease- or condition-associated polypeptide that is a polypeptide
CC produced by a pathogenic organism or a cancer, and produced by a

CC pathogenic organism selected from yeast, viruses, bacteria, helminths,
CC protozoans and mycoplasmas. The disease- or condition-associated
CC polypeptide is produced by a cancer selected from melanoma, lung cancer,
CC breast cancer, cervical cancer, prostate cancer, colon cancer, pancreatic
CC cancer, stomach cancer, bladder cancer, kidney cancer, post transplant
CC lymphoproliferative disease (PTLD) or Hodgkin's lymphoma. The uncultured
CC antigen-presenting cells or their precursors are useful in the
CC preparation of a medicament for the treatment of a disease or condition
CC in a subject, which disease or condition is associated with the presence
CC of aberrant expression of a target antigen, where the antigen-presenting
CC cells or their precursors have not been subjected to activating
CC conditions but have been contacted with an antigen that corresponds to
CC the target antigen to express a processed or modified form of the antigen
CC for presentation to the subject's immune system. The present sequence is
CC one of a set of overlapping immunogenic peptides derived from a Hepatitis
CC C virus protein.

XX CC activity of a protease. (I) is useful for detecting the activity of a
XX CC protease, which involves contacting the protease with (I), where the
XX CC activity of protease is detected in a histological section, cell culture
XX CC or tissue section. The cell suspension is derived from the biological
XX CC sample chosen from tissue, blood, urine, saliva, lymph or biopsy. The
XX CC protease activity is detected by fluorescence microscopy, fluorescence
XX CC microplate reader, absorption microplate reader, flow cytometry,
XX CC fluorometry, absorption spectroscopy or confocal fluorescent microplate
XX CC reader. (I) is useful for delivering a molecule into a cell, and for
XX CC screening a test agent for the ability to modulate the activity of the
XX CC protease. (I) is useful for detection and localisation of protease
XX CC activity in biological samples. (I) also acts as a protease inhibitor,
XX CC thus useful as protease inhibitors. (I) enables detection of the protease
XX CC activity, and provides a high intensity fluorescent signal at a visible
XX CC wavelength when they are digested by a protease. The present sequence
XX CC represents a fluorogenic protease indicator peptide of the invention.

XX XX Solid phase immunoassay using oligo:nucleotide as label - also new
XX PT conjugates of oligo:nucleotide coupled to antigenic peptide, partic. for
XX PT diagnosing hepatitis C or E virus infection.
XX XX Example; Page 18; 34pp; English.
XX XX AAR62941 and AAR62942 are examples of synthetic immunoreactive peptides.
XX CC They are used in a method for detecting an antigen in a subject. The
XX CC method involves binding the antigen to a solid support and then reacting
XX CC it with an immunoreactive ligand (L) bound to an oligo; removing any
XX CC unreacted L, and then detecting the presence of the oligo. A similar
XX CC method can be used to detect Abs, in which case the ligand is an oligo-
XX CC labelled Ag. The use of an amplifiable oligo as the label allows Ag or Ab
XX CC to be detected at very low levels. In the example, a synthetic peptide
XX CC from the NS4 protein of the hepatitis C virus with structure (AAR62943)
XX CC is biotinylated using a commercially available kit. A biotinylated oligo
XX CC with the structure 5'-biotinylated-AAQ75033-3' was prep'd. This oligo is
XX CC composed of sequences of two PCR primers sepd. by a short additional
XX CC sequence. The shorter the region to be amplified the better the
XX CC efficiency of amplification obtd. The biotinylated oligo is pre-
XX CC incubated with streptavidin. Then this complex linked by biotin-
XX CC streptavidin binding. This INAA complex is then used in place of
XX CC chemically prep'd. oligo-peptide conjugates mentioned above. (Updated on
XX CC 25-MAR-2003 to correct PN field.)

 XX This is a NS3/4A substrate fragment of hepatitis C virus (HCV) containing
 CC a NS3 protease cleavage site. This can be used to construct inhibitors of
 CC HCV NS3 protease and in assays for determining the inhibitory activity of
 CC the novel bivalent and monovalent HCV NS3 protease inhibitors. A novel
 CC bivalent inhibitor of a NS3 protease comprises a first peptide that is a
 CC subsequence, mutated subsequence or a mutated full-length sequence of the
 CC NS3 substrate linked to a second peptide that is a subsequence of the HCV
 CC NS4A polypeptide. These bivalent inhibitors and other monovalent
 CC inhibitors of an HCV protease comprising a subsequence, mutated
 CC subsequence or a mutated full-length sequence of the substrate of HCV NS3
 CC protease or a subsequence, mutated subsequence or mutated full-length
 CC sequence of NS4A are used to treat HCV infection. They act by inhibiting
 CC the interaction between NS3 and at least one of its substrates and the
 CC NS4A co-factor. Compared with inhibitors that target only one component,
 CC the bivalent inhibitors may have higher binding affinity and better
 CC discrimination against similar host cell enzymes, i.e. reduced toxicity.
 CC The peptide inhibitors can be assessed for their inhibitory activity by a
 CC scintillation proximity assay using NS3, NS4 and peptide substrates 4B/5A
 CC or 5A/5B. The inhibitors are made by usual methods of solid phase
 CC synthesis and can be administered orally or by injection or by
 CC transdermal diffusion, optionally conjugated to a carrier protein

Bivalent and monovalent inhibitors of hepatitis C virus NS3 protease.
Disclosure; Col 3-4; 27pp; English.
The invention provides bivalent inhibitors of hepatitis C virus (HCV) NS3
protease. The bivalent inhibitor comprises: (a) a first peptide
consisting of a subsequence, a mutated subsequence or a mutated full-
length sequence of a substrate of the HCV NS3 protease which is not
cleaved by the protease; (b) a second peptide consisting of a subsequence
of a HCV NS4A polypeptide (sequences AY57195-201); (c) a linker
comprising a chemical entity capable of forming a bond with the first
peptide and the second peptide and is equivalent in length to a carbon
chain having 7-14 carbon atoms. Monovalent inhibitors of the HCV NS3
protease inhibit either the interaction of a substrate or the cofactor
NS4A with the NS3 protease, and the bivalent inhibitor inhibits the
interaction of the NS3 protease with both cofactor NS4A and a substrate
of the NS3 protease. The mono- and bivalent inhibitors are useful for
treating an individual infected with the HCV. The bivalent enzyme
inhibitors provide a higher binding affinity (potency), as well as
enhanced specificity against similar cellular host enzymes for reduced
toxicity effects. The present sequence represents the NS4A/4B cleavage
site

 FT Fusion molecules comprising protein transduction domains and therapeutic
 PT agents, useful for treating e.g. Alzheimer's and Parkinson's diseases,
 PT dementia and epilepsy.

XX PS Disclosure; Page 63; 19pp; English.

XX CC The invention relates to a novel fusion molecule comprising at least one protein transduction domain (PTD) and at least one linked molecule, where the linked molecule has therapeutic or prophylactic activity against a medical condition. The invention also relates to methods of drug discovery in which the test compound is linked to a suitable transducing protein and introduced to a cell; a method of killing resistant microorganisms using a suitable fusion molecule; a mammal comprising a covalently linked fusion molecule; and a mammal adapted for experimental use in which at least one transduction molecule has been transduced into essentially all the cells of the mammal. The fusion molecule is used to deliver a therapeutic agent to a mammal, especially a human. The linked molecule may be a vaccine, an anti-infective drug, a cardiovascular drug, an antitumour drug, an analgesic, an antiinflammatory, a diagnostic marker or a drug for the treatment or prevention of a central or peripheral nervous system disorder. The central nervous system (CNS) disorder is especially Alzheimer's disease, Parkinson's disease, Huntington's disease, and also includes pre-senile dementia, epilepsy and seizures, compulsive behaviour, meningitis (including viral and bacterial meningitis), encephalitis, ischaemia, scrapie (or related spongiform encephalopathies), dyslexia, age-related memory loss or Lou Gehring's disease. Fusion molecules can also be used to kill virally infected cells, especially those infected with HIV. The vaccines are used to treat or prevent bacterial or viral infections. The methods are a highly effective means for transducing a molecule into an entire mammal or into specific cells, tissues, organs and systems within it. They also overcome bioavailability problems that are associated with many therapeutic agents (e.g., large molecular size, hydrophobicity, hydrophilicity, biological resistance), by providing efficient transduction of the target cell. The present sequence represents a protease cleavage site which may be used in the fusion molecules of the invention

New purified or isolated nucleic acid useful for enhancing an immune
response to a hepatitis C antigen comprises specific nucleotide sequences
and the amino acid sequences.
Example 1; SEQ ID NO 14; 83pp; English.
The invention relates to a purified or isolated nucleic acid. The
peptides are useful as immunogens for the treatment and prevention of
hepatitis C virus (HCV) infection, in vaccine and immunogen compositions.
The nucleic acid and the peptide enhance an immune response to a
hepatitis C antigen and are potent immunogens. The present sequence is
used in the exemplification of the invention.

 PT New synthetic polypeptides having several different segments of at least
 PT one parent polypeptide linked together differently compared to the
 PT linkage in the parent polypeptide, for inducing immune response against a
 PT pathogen or cancer.
 XX
 PS Example 2; Fig 26; 364pp; English.
 XX
 CC The invention relates to a new synthetic polypeptide (I) comprising
 CC several different segments of at least one parent polypeptide linked
 CC together in a different relationship relative to their linkage in the
 CC parent polypeptide to impede, abrogate or otherwise alter at least one
 CC function associated with the parent polypeptide and for inducing an
 CC immune response against a pathogen or cancer. Also included are a
 CC synthetic polynucleotide encoding and a computer system for designing the
 CC synthetic polypeptides. The synthetic polypeptides and polynucleotides
 CC are referred to as a Savine. The synthetic polypeptide is useful for
 CC modulating immune responses preferably directed against a pathogen or a
 CC cancer, (e.g., cancers of the lung, breast, ovary, cervix, colon, head
 CC and neck, pancreas, prostate, stomach, bladder, kidney, bone liver,
 CC oesophagus, brain, testicle, uterus), as potentiating agents.
 CC Compositions comprising the polypeptide may be used in the treatment or
 CC prophylaxis against viral (such as infections caused by HIV (human
 CC immunodeficiency virus), hepatitis, influenza, Japanese encephalitis
 CC virus, Epstein-Barr virus and respiratory syncytial virus), bacterial
 CC (e.g., infections caused by Neisseria, Meningococcal, Haemophilus,
 CC Salmonella, Streptococcal, Legionella and Mycobacterium or parasitic
 CC (e.g., infections caused by Plasmodium, Schistosoma, Leishmania,
 CC Trypanosoma, Toxoplasma and Giardia) infections. The present sequence is
 CC a peptide derived from a parent protein used to construct a savine of the
 CC invention

XX
XX Therapeutic composition for preventing or treating inflammatory or immune
XX -mediated disorders comprises a Hepatitis C virus (HCV) protein activated
XX by an agent that suppresses inflammatory cytokine or promotes IL-10
XX production.
XX
XX Disclosure; SEQ ID NO 2; 43pp; English.
XX
XX The present sequence is the protein sequence of hepatitis C virus (HCV)
XX genotype 1a non-structural protein NS4 peptide fragment comprising amino
XX acid residues 1694-1735 of the HCV polyprotein. The invention provides a
XX method for the treatment and/or prophylaxis of an inflammatory and/or
XX immune-mediated disorder and/or disorders associated with transplantation
XX comprising the step of administering an HCV protein (NS4 or NS3) or its
XX derivative, mutant, fragment or variant, or the product of cells
XX activated thereby. In one case, the HCV protein or its product suppresses
XX inflammatory cytokine production and also promotes interleukin-10
XX production, particularly by peripheral blood mononuclear cells and/or
XX monocytes. It may also inhibit dendritic cell activation, inhibit the
XX induction or activation of Th1 or Th2 cells, modulate inflammatory cytokine
XX ligand-induced NFkappaB activation, or modulate inflammatory cytokine
XX production induced by infection or trauma. A claimed therapeutic
XX composition and a claimed vaccine adjuvant comprise HCV NS4 or its
XX derivative, mutant, fragment or variant or the product of cells activated
XX thereby. It can be used in the treatment or prophylaxis of sepsis or
XX acute inflammation induced by infection, trauma or injury, chronic
XX inflammatory disease, graft rejection or graft versus host disease, an
XX immune mediated disease involving Th1 responses, a disease or condition
XX involving toll-like receptor dependent signalling, an immune mediated
XX disease involving inflammatory cytokines including tumour necrosis factor
XX -alpha and interleukin-1, Crohn's disease, inflammatory bowel disease,
XX multiple sclerosis, type 1 diabetes, rheumatoid arthritis, systemic lupus
XX erythematosus, uveitis, allergy or asthma (all claimed). The present 42-
XX amino acid NS4 peptide fragment from HCV genotype 1a was shown to retain
XX the immunomodulatory activity observed in the full-length NS4 protein
XX ADT77851 from HCV genotype 1b.

CC termed SID polypeptides (selected interacting domain). These polypeptides
CC are the final products of a double selection method involving a first
CC step of selection of Hepatitis C virus (HCV)-derived polynucleotides
CC through a two-hybrid system, and a second selection step involving an
CC alignment between the different polynucleotides selected at the first
CC step. The activity of polypeptides of the invention may be described as,
CC virucide, hepatotropic, antiinflammatory and antibacterial. The
CC polypeptide, polynucleotide and compositions comprising them are useful
CC for treating or preventing viral or a bacterial infection, specifically
CC infections or pathologies caused by HCV, or those pathologies linked to
CC HCV infection. These may include liver disease and liver cancer. The
CC current sequence represents a selected interacting domain (SID)
CC polypeptide. Note: The sequence data for this patent is not represented
CC in the specification, but is based on sequence information supplied by
CC the European Patent Office

 Peptide(s) for hepatitis-C virus detection - their use in immunological tests, and single test for the detection of different epitope(s) from different pathogens.
 Claim 1; Page 71; 94pp; German.
 The peptide is residues 121-175 of the open reading frame of hepatitis C

CC virus construct C-100-3 (this sequence is a fragment of that given in EP-318216). The fragments listed in the features table are also claimed. The fragments react specifically with antibodies to hepatitis C virus. They are useful as assay reagents for diagnosis of HCV infection, allowing a decrease in false positives cf. known methods. The DNA sequences encoding the peptides are useful as hybridisation probes for detection and/or determin. of HCV. Antibodies raised to the peptide are useful CC diagnostically and therapeutically, esp. as immunoassay reagents. By using 2 or more peptides with specific affinity for early and late anti-HCV antibodies, differential diagnosis of acute and chronic infections CC may be achieved of HIV, HTLV, hepatitis B virus and Treponema pallidum XX

 XX
 CC In selecting regions of the HCV protein for epitope analysis, peptides in
 CC the 40 mer size range with amino acid sequences covering the complete HCV
 CC C-100 protein and the core protein were synthesised. These were tested
 CC for their reactivity with serum from a patient positively diagnosed with
 CC HCV infection. The indicated six overlapping peptides from the HCV C-100
 CC protein region were found to have specific immunoreactivity with the
 CC positive control serum. The peptides may be used in highly sensitive and
 CC accurate methods for the early detection of antibodies to HCV in body
 CC fluids and the diagnosis of NANBHV infection. Because of their high
 CC immunoreactivity, the peptides are also useful in stimulating prodn. of
 CC antibodies to HCV and in vaccines to prevent HCV or NANBHV infection. See
 CC also AAR13558 for core protein immunodominant peptides. (Updated on 25-
 CC MAR-2003 to correct PA field.)

PT Purified hepatitis C virus - and associated nucleic acids and
PT polypeptide(s).
XX
PS Claim 13; Fig 3; 139pp; English.
XX
CC It is encoded in the open reading frame of a composite nucleotide
CC sequence derived from overlapping hepatitis C virus (HCV) cDNA in clones
CC 81, 1-2, and 91, isolated using a synthetic sequence equivalent to a
CC fragment of HCV cDNA in clone 5-1-1. It is an epitope, portions of which
CC could be used as immunoassay reagents and vaccines and to generate
CC antibodies useful in diagnosis and passive immunotherapy for HCV
CC infection/non-A, non-B hepatitis. (Updated on 25-MAR-2003 to correct PR
CC field.) (Updated on 25-MAR-2003 to correct PI field.)

XX
XX Disclosure; Page 8-9; 11pp; Japanese.
PS
XX A fused protein comprising an antigen protein derived from a blood
CC transmittable NANBHV is prepd. as follows: (1) viral DNA from a patient
CC with the disease is isolated; (2) cDNA (core gene) is prepd.; (3) DNA is
CC

```

```

CC inserted into cloning vector; (4) core gene, not including amino acids in
CC a hydrophobic region, is cloned. The envelope gene is ligated downstream
CC to the core gene and a gene encoding another antigen is further ligated
CC to the C-terminal of the envelope gene to improve expression. A
CC recombinant vector contg. the gene encoding the fusion protein is used
CC for the transformation of E.coli. The prod. expressed by E.coli is
CC isolated. Mass prodn. of a fused protein having an envelope protein
CC derived from blood transmittable NANBHV is possible. The fused protein
CC has an epitope of core protein, thus can be used for the detection and
CC diagnosis of NANBHV. (Updated on 27-AUG-2003 to correct OS field.)

XX New purified nucleic acid molecule encoding a racemase peptide isolated
PT from parasitic protozoan Trypanosoma cruzi, useful for preventing and/or
PT treating Chagas' disease.
XX
XX Example 12; Fig 6; 109pp; English.
PS
XX The present sequence is that of proline racemase from Brucella
CC melitensis. Sequence alignment of proline racemase sequences from
CC multiple organisms ADR46139-ADR46160 identified 4 motifs, designated
CC motif I ADR46161, motif II ADR46162, motif III ADR46120 and motif III*
CC ADR46121 that can be used to identify putative proline racemases in other
CC organisms. The invention relates to the identification and

```

CC characterisation of racemases, especially proline racemase, and
 CC definition of protein signatures of these racemases. It also relates to
 CC the identification of nucleic acid molecules encoding a peptide
 CC consisting of a motif characteristic of the protein signatures, to
 CC polypeptides consisting of these motifs, and to antibodies that bind such
 CC polypeptides. Methods are claimed for: producing a polypeptide consisting
 CC of a motif using bacterial, parasite or eukaryotic host cells; detecting
 CC a racemase; screening for an active molecule capable of inhibiting a
 CC racemase; detecting a D-amino acid, especially in a reaction medium
 CC comprising a sample from a patient afflicted with Alzheimer's disease,
 CC Parkinson's disease, renal disease or schizophrenia; detecting racemase
 CC activity in a reaction medium; and screening for molecules that modulate
 CC racemase activity, especially proline racemase from *Trypanosoma cruzi*
 CC (the causative agent of Chagas disease). An immunising composition
 CC containing a polypeptide comprising one of the motifs is also claimed.

XX New isolated mycobacterial peptide encoded by a gene that is induced or
 FT up-regulated under high oxygen tension, useful for diagnosing, treating
 PT or preventing a mycobacterial infection.

XX Claim 1; Page 233-234; 392pp; English.

XX The present invention describes an isolated mycobacterial peptide (I), or
 CC its fragment, variant or derivative encoded by a gene whose expression is
 CC induced or up-regulated during culture of a mycobacterium under
 CC continuous culture conditions of a dissolved oxygen tension of at least
 CC 30% air saturation measured at 37 plus degrees Celsius when compared with
 CC a dissolved oxygen tension of up to 10% air saturation measured at 37
 CC plus degrees Celsius. (I) has tuberculostatic activity and can be used in
 CC vaccines. The mycobacterial peptide (I) or its fragment, variant or
 CC derivative, inhibitor, antibody, attenuated mycobacterium, attenuated
 CC microbial carrier, DNA sequence, DNA plasmid, RNA sequence, or RNA vector

CC from the present invention can be used for manufacturing a medicament for
 CC treating or preventing a mycobacterial infection. The peptide or its
 CC fragment, variant or derivative, the antibody, or a polynucleotide probe
 CC comprising at least 8 nucleotides, where the probe binds to at least a
 CC part of the gene, is useful for manufacturing a diagnostic reagent for
 CC identifying a mycobacterial infection. The present sequence represents a
 CC Mycobacterium tuberculosis mycobacterial antigen, which is used in the
 CC exemplification of the present invention

XX
XX New NOVX polypeptides and nucleic acids, useful for preventing or
PT treating NOVX-associated disorders, e.g. cancer, cardiomyopathy,
PT atherosclerosis, or diabetes, and in chromosome mapping, tissue typing or
PT pharmacogenomics.
XX
XX Disclosure; SEQ ID NO 787; 1498pp; English.
XX
XX This invention relates to a novel nucleic acids, and encoded polypeptides
CC thereof, which have properties related to the stimulation of biochemical
CC or physiological responses in a cell, tissue, organ or organism.
CC Specifically, it refers to the use of biologically active fragments for
CC diagnostic and prognostic assays and furthermore in the treatment of
CC diverse pathological conditions. The present invention describes novel
CC human and murine NOVX proteins, as well as methods to modulate their
CC expression using antisense oligos, ribozymes and peptide nucleic acids.
CC The NOVX polypeptides, polynucleotides and antibodies are useful in
CC treating or preventing NOVX-associated disorders, e.g. cardiomyopathy,
CC atherosclerosis, cancer and diabetes. Furthermore, they may be used in
CC treating or preventing diseases such as inflammation, autoimmune
CC disorders, allergies, blood disorders, acquired immunodeficiency syndrome
CC (AIDS), obesity, asthma, immunoglobulin (IgA) nephropathy, cirrhosis,
CC arthritis, Alzheimer's disease, infections, stroke, muscular dystrophy
CC and epilepsy. Accordingly, these molecules have many activities including
CC cytoskeletal, cardiac, antiinflammatory, immunosuppressive, antiallergic,
CC haemostatic, anti-HIV, antidiabetic, antiarteriosclerotic, anorectic,
CC antiasthmatic, nephrotropic, antiarthritic, hepatotropic,
CC neuroprotective, nootropic, antibacterial, virucide, antiparasitic,
CC relaxant and anticonvulsant. In addition, they are useful in screening
CC assays to identify small molecules that modulate or inhibit, for example,
CC neurogenesis, wound healing and angiogenesis. The nucleic acids are also
CC used as in chromosome mapping, tissue typing, preventive medicine and
CC pharmacogenomics. This polypeptide is a homologue of a human NOVX protein
CC of the invention.

PT Soluble fragment of hepatitis C virus NS3 helicase and related fusion
PT proteins - useful for screening cpds. for anti-HCV activity.
XX
PS Claim 1; Page 8-9; 40pp; English.
XX
CC This sequence represents a hepatitis C virus (HCV) nonstructural protein
CC 3 (NS3) helicase fragment, comprising amino acids 167-631 of the NS3
CC protein AAW31884. NS3 has a conserved sequence of motifs of a serine type
CC proteinase, and of a nucleoside triphosphate (NTPase)/RNA helicase. One
CC third of the N-terminal of the HCV NS3 protein has been shown to be a
CC trypsin like serine proteinase. Two thirds of the NS3 C-terminal fragment
CC has been shown to encode NTPase activity. The helicase fragment of
CC NS3, comprising amino acids 1193-1657 of the NS3 protein, is used to
CC screen compounds for specific inhibitory activity, i.e. to identify
CC potential anti-HCV agents. The N and C termini of the present sequence
CC are putative, the actual termini being defined by expressing and
CC processing in an appropriate host. Truncated NS3 helicase fragment
CC analogues and NS3 helicase mutants have also been produced. Helicase
CC fragments with N-terminal truncations (up to 20 amino acids) are soluble
CC in purification and assay buffers, unlike full-length NS3 protein.
CC Expression of a soluble protein eliminates the need for denaturing and
CC refolding, and also provides higher yields. Expression of NS3 as a fusion
CC protein allows products to be quantified by colourimetric assay and
CC purified by metal-chelate chromatography

 DR Novel molecule/molecular complex for solving structures of other
 XX molecules/complexes, comprises portion of Hepatitis C virus helicase or
 PT helicase-like domain 1/domain 2 interface or oligonucleotide binding
 PT site.
 XX Claim 15; Fig 2; 255pp; English.
 PS This invention describes a novel molecule or complex (I) comprising a
 XX portion of Hepatitis C virus helicase or helicase-like domain 1/domain 2
 CC

CC interface (D) or oligonucleotide binding site (O) where (D) or (O) is
 CC defined by a set of points having a root mean square deviation of less
 CC than about 1.5 Angstrom from points representing the backbone atoms of
 CC the amino acids as represented by the protein structure coordinate data
 CC of UHCV-A, UHCV-B, or UHCV given in the specification. The products of
 CC the invention have virucide activity and inhibit HCV helicase activity.
 CC The method described in the invention is useful for solving the
 CC structures of other molecules or molecular complexes, in drug discovery,
 CC for designing inhibitors of HCV helicase-like binding sites, and for
 CC solving the structure of HCV helicase, HCV helicase mutants or HCV
 CC helicase homologs co-complexed with a variety of chemical entities.
 CC This sequence represents the HCV NS3 helicase described in the method of
 CC the invention. (Updated on 07-AUG-2003 to correct OS field.)

XX New hepatitis C virus gene and its encoded protein - used for diagnosing
 PT and vaccinating against hepatitis C virus infections.

XX Disclosure; Page 131-34; 305pp; English.

XX The sequences given in AAR29660, AAR29559-60 and AAR29843-51 were encoded
 CC by clones which encode the NS2-NS4 regions of the Hepatitis C Virus (HCV)
 CC gene of the invention. These sequences were isolated from the serum of a
 CC patient suffering from hepatitis C (HC). The NS2-NS4 RNA sequences were
 CC converted into cDNA using transcriptase in the presence of one of the
 CC primer sequences given in AAQ32553-64. The cDNA sequences were then
 CC amplified using primer pairs. The cDNA sequences isolated represent
 CC different alleles of the same region of the HCV gene. Sequence
 CC comparisons of these clones showed that it is possible for a patient to
 CC carry more than one HCV strain at one time. See also AAQ32436. (Updated
 CC on 25-MAR-2003 to correct PN field.)

XX Identifying the presence of an antibody in a fluid sample, where the

PT antibody is immunologically reactive with a Hepatitis C virus (HCV)

PT antigen by contacting the fluid sample, which may contain a HCV antibody

PT with at a polypeptide.

XX Claim 1; Col 205-208; 168pp; English.

XX

CC The invention relates to a method for identifying the presence of an
 CC antibody immunologically reactive with a Hepatitis C virus (HCV) antigen.
 CC The method involves providing a fluid sample containing at least one HCV
 CC antibody, contacting the fluid sample with at least one polypeptide or
 CC recombinant fusion protein for complexing the antibody with the
 CC polypeptide or recombinant fusion protein to provide an antibody-
 CC polypeptide complex and detecting the complex. The present sequence is
 CC pHCV-23 fusion protein which comprises Escherichia coli CKS (CTP: CMP-3-
 CC deoxy-manno-octulosonate cytidyl transferase or CMP-KDO synthase)
 CC enzyme, linker and HCV (non- structural region) NS4 region. This sequence
 CC is used in the invention

XX
XX Soluble fragment of hepatitis C virus NS3 helicase and related fusion
PT proteins - useful for screening cpds. for anti-HCV activity.
XX
XX Disclosure; Fig 1; 40pp; English.
XX
XX This sequence represents one of the hepatitis C virus (HCV) nonstructural
CC protein 3 (NS3) molecules. It is approximately 1027-1657 amino acids of
CC the HCV-1 polyprotein. This protein has a conserved sequence of motifs of
CC a serine type proteinase, and of a nucleoside triphosphate (NTPase)/RNA
CC helicase. One third of the N-terminal of the HCV NS3 protein has been
CC shown to be a trypsin like serine proteinase. Two thirds of the NS3 C-
CC terminal fragment has been shown to encode NTPase/RNA activity. The
CC helicase fragment of NS3, comprising amino acids 1193-1657 of the NS3
CC protein, is used to screen compounds for specific inhibitory activity,
CC i.e. to identify potential anti-HCV agents. Helicase fragments with N-
CC terminal truncations (up to 20 amino acids) are soluble in purification
CC and assay buffers, unlike full-length NS3 protein. Expression of a
CC soluble protein eliminates the need for denaturing and refolding, and
CC also provides higher yields. Expression of NS3 as a fusion protein allows
CC products to be quantified by colourimetric assay and purified by metal-
CC chelate chromatography

XX New chromogenic, fluorogenic and fluorescence polarization hepatitis C
XX virus (HCV) substrates useful in HCV NS3 protease and inhibitor assays.
XX Example 1; Col 33-36; 21pp; English.
PS The invention relates to a chromogenic, fluorogenic and fluorescence
CC polarisation hepatitis C virus (HCV) substrate. The substrate comprises a
CC single chromophore or fluorophore linked to the C-terminus of a peptide
CC sequence, or a fluorescence polarisation HCV substrate comprising a
CC peptide sequence linked at opposite ends of the cleavage site to a
CC fluorophore and a high molecular weight binding group. The chromogenic,
CC fluorogenic and fluorescence polarisation peptide substrates provide
CC optimised specificity, better cleavage efficiency and improved
CC detectability. The chromogenic, fluorogenic and fluorescence polarisation
CC peptide substrates are useful in discovering inhibitors of HCV proteases,
CC in progress curve analysis for reversible and irreversible binding
CC inhibitors for the HCV NS3 protease. These substrates may also be used in
CC monitoring of inhibition kinetics and rapid characterisation of HCV NS3
CC protease inhibitors, and to aid in the classification of inhibitors
CC binding to either the S or S' pocket. The present sequence is HCV NS3
CC protease full length HCV 1a(H) non-covalent complex

PT responsible for genetic disorders or other traits and to assess
PT biodiversity.
XX
XX Claim 20; SEQ ID NO 45743; 103pp; English.
XX The invention relates to isolated polynucleotide (I) and polypeptide (II)
CC sequences. (I) is useful as hybridisation probes, polymerase chain
CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
CC and in recombinant production of (II). The polynucleotides are also used
CC in diagnostics as expressed sequence tags for identifying expressed
CC genes. (I) is useful in gene therapy techniques to restore normal
CC activity of (II) or to treat disease states involving (II). (II) is
CC useful for generating antibodies against it, detecting or quantitating a
CC polypeptide in tissue, as molecular weight markers and as a food
CC supplement. (II) and its binding partners are useful in medical imaging
CC of sites expressing (II). (I) and (II) are useful for treating disorders
CC involving aberrant protein expression or biological activity. The
CC polypeptide and polynucleotide sequences have applications in
CC diagnostics, forensics, gene mapping, identification of mutations
CC responsible for genetic disorders or other traits to assess biodiversity
CC and to produce other types of data and products dependent on DNA and
CC amino acid sequences. ABG0010-ABG30377 represent novel human diagnostic

XX Hepatitis C virus-CKS fusion protein - produced using vector contg. lac

PT control region.

XX Example; Fig 8; 40pp; English.

XX CKS methods of protein synthesis are known in the art, for inst. a CKS
 CC method has been disclosed in EP-A- 0331 961. Six individual nucleotides
 CC representing AAs 11-150 of the HCV genome were ligated together and
 CC cloned as a 466 base pair EcoRI-BamHI fragment into the CKS fusion vector
 CC pJ0200 to produce pHCV-34. The resultant fusion protein HCV CKS-Core,
 CC consists of 239 AAs of CKS, 7 AAs contributed by linker DNA sequences,
 CC and the first 150 AAs of HCV. To construct the plasmid pHCV-31, the 781
 CC base pair EcoRI-BamHI fragment from pHCV-23 representing the HCV-BCD
 CC region was linker-adapted and ligated into pHCV-29. The resulting
 CC plasmid, designated pHCV-31, expresses HCV CKS-33-BCD recombinant antigen
 CC which consists of 239 AAs of CKS, 8 AAs contributed by linker DNA
 CC sequences, 266 AAs of the HCV NS3 region (AAs 1192-1457), 2 AAs
 CC contributed by linker DNA sequences, 256 AAs of the HCV NS4 region (AAs
 CC 1676-1931), and 10 additional AAs contributed by linker DNA sequences.

XX Recombinant hepatitis C virus antigens - produced as fusion proteins and
PT representing distinct antigenic regions of the HCV genome.
XX Disclosure; Fig 11, Page 37-43; 115pp; English.
XX The protein (mol.wt. 90 kD), encoded by pHCV-31, is composed of two non-
CC contiguous coding regions located in the putative non-structural regions
CC of HCV designated NS-3 and NS-4. Clone BCD represents the C-terminal 256
CC amino acids of c100-3; the N-terminal amino acids are not represented.
CC The polypeptide represents a distinct antigenic region of the HCV genome
CC and can be used for the detection of antibodies and antigens for early
CC diagnosis of HCV infection. The polypeptide can also be used to develop
CC specific inhibitors of viral replication and for therapeutic purposes.

PT Prodn. of recombinant hepatitis virus core protein - as fusion protein
 PT with E. coli enzyme CKS.
 XX

PS Example 12; Fig 24; 63pp; English.
 XX

CC The Hepatitis core virus protein (HCV) coding sequence was used in the
 CC construction of an expression vector designated pHCV-31. This vector
 CC allows the fusion of recombinant proteins to a CKS (CTP-CMP-3-deoxy-D-
 CC manno-octulosonate cytidyl transferase or CMP-KDO synthetase) protein.
 CC The use of the CKS protein coding sequence in the construct facilitates
 CC the detection and purification of heterologous proteins and gives fusion
 CC proteins which are expressed at high levels. The HCV CKS-33-BCD antigen
 CC expressed comprises 239 amino acids of CKS, eight amino acids contributed
 CC by linker DNA sequences, 266 amino acids of the HCV NS3 region, 2 amino
 CC acids contributed by linker DNA sequences, 256 amino acids of the HCV NS4
 CC region and 10 additional amino acids contributed by linker (Updated on 25
 CC -MAR-2003 to correct PF field.)

 PT Identifying the presence of an antibody in a fluid sample, where the
 PT antibody is immunologically reactive with a Hepatitis C virus (HCV)
 PT antigen by contacting the fluid sample, which may contain a HCV antibody
 PT with at a polypeptide.
 XX
 XX Example 2; Col 53-56; 168pp; English.
 PS
 XX The invention relates to a method for identifying the presence of an
 CC antibody immunologically reactive with a Hepatitis C virus (HCV) antigen.
 CC The method involves providing a fluid sample containing at least one HCV
 CC antibody, contacting the fluid sample with at least one polypeptide or
 CC recombinant fusion protein for complexing the antibody with the
 CC polypeptide or recombinant fusion protein to provide an antibody-
 CC polypeptide complex and detecting the complex. The present sequence is
 CC pHCV-31 fusion protein which comprises Escherichia coli CKS (CTP: CMP-3-
 CC deoxy-manno-octulosonate cytidyl transferase or CMP-KDO synthase)
 CC enzyme, linker and HCV (non- structural region) NS3 and NS4 region. This
 CC sequence is used in the invention

PS Claim 17; Page 6; 31pp; English.
XX
CC AAW71273-83 represent cleavable substrate peptide sequences. The
CC specification describes a fusion protein derived from the Hepatitis C
CC virus (HCV) NS3 protease and NS4A cofactor proteins (NS3/4A). A non-
CC autocleavable fusion protein of HCV NS3 protease and HCV NS4A cofactor
CC protein is produced upon expression, which is biologically active. The
CC products can be used to obtain drugs which can inhibit NS3 protease
CC activity for use in HCV therapy. They can also be used to design
CC compounds which interact with or inhibit the NS3/4A fusion proteins

fluorene-carboxylic group, 9-fluorene-carboxylic group, and 9-fluorenone-1-carboxylic group, benzoyloxy-carbonyl, Xanthyl (Xan), Trityl (Trt), 4-methyltrityl (Mtt), 4-methoxytrityl (Mmt), 4-methoxy-2,3,6-trimethylbenzenesulphonyl (Mtr), Mesitylene-2-sulphonyl (Mts), 4,4'-dimethoxybenzhydryl (Mbh), etc. The method described in the invention is useful for detecting protease or nuclease activity (or the presence of nuclease acid) in histological section, cells in culture, (e.g., seeded or cultured adherent cells), a biological sample such as tissue, biopsy, lymph, embryo, or whole animal, or cell suspension derived from a biological sample such as tissue, blood, urine, saliva, lymph, or biopsy. The indicator composition is also useful for screening a test agent for the ability to modulate a protease (or a nuclease, lipase, etc.). The indicator reagents allow rapid determination of protease activity in a matter of minutes in a single-step procedure. The fluorescent indicators both absorb and emit in the visible range (400-800 nm). These signals are therefore not readily quenched by, nor is activation of the fluorophores, that is, absorption of light, interfered with by background molecules; therefore they are easily detected in biological samples. The fluorogenic protease indicators utilise high efficiency fluorophores and are able to achieve a high degree of quenching while providing a strong signal when the quench is released by cleavage of the peptide substrate. The high signal allows detection of very low levels of protease activity. Thus the fluorogenic protease indicators are particularly well suited for in situ detection of protease activity. ABU60357-ABU60477 represent peptides use to illustrate the method described in the disclosure of the invention

XX PT New peptides useful, e.g. in the treatment of or reduction of viral load

PT of hepatitis C virus and associated conditions, e.g. liver fibrosis,
XX necrosis, inflammation or bile duct changes.

XX Example 3; Fig 7; 30pp; English.

XX This invention relates to novel hepatitis C virus (HCV) protease
CC inhibitors. Specifically, these inhibitors are small, hydrophobic
CC peptides that work by affecting the activity of the HCV serine protease
CC NS3, or preventing NS3 activation by inhibition of its co-factor NS4A.
CC Chronic infection with HCV can lead to serious sequelae including
CC chronic active hepatitis, cirrhosis and hepatocellular carcinoma, as well
CC as HCV associated conditions including liver fibrosis, necrosis,
CC inflammation or bile duct changes. The present invention describes these
CC peptide inhibitors as virucides, and as such they can be used to inhibit
CC HCV replication and reduce the viral load. They also have hepatotropic
CC and antiinflammatory activity and can be described as cytostatic.
CC Furthermore, the antiviral peptides derived from the relevant conserved
CC NS3 or NS4A domains can be used to treat other viruses including the
CC dengue fever virus and the bovine viral diarrhoea virus. This peptide
CC sequence, peptide 15 (SeqID 34), is part of the C-terminal deletion
CC library that was used to identify the minimal domain of NS4A that is
CC required for binding to the NS3 protease, and hence identify inhibitor
CC peptides of the invention

XX PT New T-cell epitope, used as diagnostic tools and as vaccines/composition
XX for the treatment and prevention of hepatitis C.

XX PS Claim 1; SEQ ID NO 39; 122pp; English.

XX The invention relates to a novel cytotoxic Hepatitis C virus (HCV) T-cell
CC epitope, comprising any of the 429 fully defined amino acid sequences, or
CC their variations, given in the specification. The invention further

CC comprises: a method for predicting peptides that can be used as epitopes
 CC or as diagnostic tools; a prediction of the neural network combined with
 CC a prediction or measurement of one of the following: proteasomal cleavage
 CC sites, MHC binding, presence of sequence or related sequence(s) in patent
 CC databases, TAP binding, gene or protein expression level, function of the
 CC protein, or similarity of self proteins; and a vaccine and a diagnostic
 CC tool, each using a limited number such as at least 1-5, 8, 16, 32, 64,
 CC 128, 256, or 512 of any of the peptides stated above or any of the
 CC peptides predicted using the method above. The cytotoxic HCV 1-cell
 CC epitopes have antiinflammatory, virucide, and hepatotropic activities.
 CC The epitopes are useful as vaccines and as diagnostic tools. The vaccines
 CC and compositions are useful for treating and preventing hepatitis C virus
 CC infection. This sequence represents one of the 429 cytotoxic hepatitis C
 CC virus 1-cell epitopes of the invention.

XX New isolated hepatitis C virus NS3 polypeptide(s) - useful in high-
 PT throughput assays for detecting inhibitors which can be used to inhibit
 PT virus replication.

XX Claim 5; Page 46; 70pp; English.

XX A synthetic peptide (AAW13785) corresponds to a serine-substd., C- and N-
 CC terminally deleted version of the hepatitis C virus (HCV) polypeptide
 CC NS4A/4B junction (see also AAW13778). Peptides (AAW13771-86) and
 CC deipeptides (AAW13787-91) based on this junction region can be used as
 CC substrates in high throughput assays of NS3 protease activity (see also
 CC AAW13766-70). The peptides are cleaved into detectable products. The
 CC assays can be used to identify NS3 protease inhibitors and therefore
 CC therapeutic agents for use against HCV

residues at specified positions.
XX
Example 11; Page 25; 38pp; English.
XX
The invention describes an immunogenic peptide composition comprising 9
residues including a first conserved residue at a second position from N-
terminus, and a second conserved residue at C-terminal position. The
inventive peptide composition is used to elicit an immune response
against a desired antigen for preventing, treating or diagnosing
pathological states, e.g. prostate cancer, hepatitis B, hepatitis C,
AIDS, renal carcinoma, cervical carcinoma, lymphoma, cytomegalovirus
(CMV), and condyloma acuminatum. It is also used to treat autoimmune
```

CC associated disorders, e.g. multiple sclerosis, rheumatoid arthritis,
CC Sjogren syndrome, scleroderma, polymyositis, dermatomyositis, systemic
CC lupus erythematosus, juvenile rheumatoid arthritis, ankylosing
CC spondylitis, myasthenia gravis (MG), bullous pemphigoid, pemphigus,
CC glomerulonephritis, Goodpasture's syndrome, autoimmune hemolytic anemia,
CC Hashimoto's disease, pernicious anaemia, idiopathic thrombocytopenic
CC purpura, Grave's disease, and Addison's disease. The invention defines
CC positions within a motif enabling the selection of the peptides, which
CC will bind efficiently to human leukocyte antigen (HLA) A2.1. This is the
CC amino acid sequence of an immunogenic HLA-A2.1 binding peptide.

 XX New peptides useful, e.g. in the treatment of or reduction of viral load
 PT of hepatitis C virus and associated conditions, e.g. liver fibrosis,
 PT necrosis, inflammation or bile duct changes.
 XX Example 3; Fig 7; 30pp; English.
 XX This invention relates to novel hepatitis C virus (HCV) protease
 CC inhibitors. Specifically, these inhibitors are small, hydrophobic
 CC peptides that work by affecting the activity of the HCV serine protease

CC NS3, or preventing NS3 activation by inhibition of its co-factor NS4A.
 CC Chronic infection with HCV can lead to serious sequelae including
 CC chronic active hepatitis, cirrhosis and hepatocellular carcinoma, as well
 CC as HCV associated conditions including liver fibrosis, necrosis,
 CC inflammation or bile duct changes. The present invention describes these
 CC peptide inhibitors as virucides, and as such they can be used to inhibit
 CC HCV replication and reduce the viral load. They also have hepatotropic
 CC and antiinflammatory activity and can be described as cytostatic.
 CC Furthermore, the antiviral peptides derived from the relevant conserved
 CC NS3 or NS4A domains can be used to treat other viruses including the
 CC dengue fever virus and the bovine viral diarrhoea virus. This peptide
 CC sequence, peptide 16 (SeqID 22), is part of the C-terminal deletion
 CC library that was used to identify the minimal domain of NS4A that is
 CC required for binding to the NS3 protease, and hence identify inhibitor
 CC peptides of the invention

XX Modulating insulin activity in mammalian cells, for treating e.g.
XX diabetes and tumors, comprises using peptides that bind to insulin or
XX insulin-like growth factor receptors.

XX Disclosure; Fig 3D-1; 390pp; English.

XX The invention relates to a method of modulating insulin activity in
XX mammalian cells by administering a peptide that binds the insulin

CC receptor (IR). A composition containing a peptide, optionally expressed
CC from gene therapy vectors, that binds to Site 1 of IR and an insulin
CC agonist are useful for treating diabetes. Also, peptides that are
CC antagonists of the insulin-like growth factor-1 (IGF-1) receptor are
CC useful for treating insulin-like growth factor (IGF)-sensitive tumours
CC (e.g. of prostate and breast) and diabetic retinopathy, while IGF-1
CC receptor agonists are useful for treating neurological diseases,
CC including stroke and diabetic neuropathy. The peptides are also useful in
CC screening for compounds that bind to IR or IGF-1 receptor, potential
CC therapeutics and research reagents. AAU8034-AAU9057 represent IR and/or
CC IGF-1 receptor-binding peptides and related amino acid sequences of the
CC invention

XX DNA encoding antigenic peptide(s) of new types of hepatitis C virus - for
XX diagnosing and treating HCV infection, screening blood samples and
XX identifying different HCV types.

XX Disclosure; Page 40; 120pp; English.

XX The sequences given in AAR37938-47 are peptides which were derived from
XX the NS-4 region of the hepatitis C virus (HCV) protein. Analysis of
XX regions of the HCV genome revealed the existence of three distinct groups
XX of HCV. Analysis of the region encompassing -255 to -62 of the 5' non
XX coding region (NCR) (see AAQ43058-75) showed a difference of 9-14% in the
XX nucleotide sequences between the three groups. Two of the groups
XX identified were similar to those of HCV variants termed type 1 and 2,
XX whilst the third appeared to represent a novel type of virus. Comparison
XX of the NS3 region (see AAR37927-30) showed a high degree of sequence
XX diversity with type 3 being phylo- genetically different to type 1 and 2.
XX The same degree different- iation was noted in the NS-5 (see AAR37923-

CC 26), core region (see AAR37931) and the NS4 region (see AAQ43106-111)
CC between type 3 and type 1 sequences. (Updated on 25-MAR-2003 to correct
CC PN field.)

XX New fluorogenic compositions - containing 2 fluorophores separated by a
PT peptide comprising a protease binding site, used for detecting protease
PT activity in samples.

PS Disclosure; Page 27; 90pp; English.

XX AAW82023-W82240 are peptides used in the construction of a fluorogenic
CC composition which is used for the detection of protease activity in
CC biological samples. The products can be used for the detection of
CC conformational changes in nucleic acids, oligosaccharides, polysaccharides,
CC proteins, peptides, lipids, phospholipids, glycolipids, glycoproteins, a
CC molecule or polymers. In addition, attachment of a hydrophobic group to a
CC molecule can be used to enhance uptake by cells. The composition is
CC composed of P = peptide comprising a protease binding site for the
CC protease, F1, F2 peptides = fluorophores where F1 is attached to the
CC amino terminal amino acid and F2 is attached to the carboxyl terminal
CC amino acid and S1, S2 peptides = when present, are peptide spacers where
CC S1, when present, is attached to the amino terminal acid, and S2, when
XX present, is attached to the carboxyl terminal amino acid

XX New fluorogenic compositions whose fluorescence level increases in the
PT presence of active proteases, useful for detecting and localizing
PT protease activity in biological samples, particularly in frozen tissue
PT samples.

PS Disclosure; Page 26; 86pp; English.

XX The present invention describes fluorogenic compositions which can be
CC used for the detection of protease activity. This can be useful as an
CC indicator of viral infection, cancer metastasis, haemophilia, emphysema,
CC thrombosis and arthritis. The fluorogenic compositions comprise a
CC peptide, a peptide spacer and a donor and an acceptor fluorophore. The
CC peptide is cleaved by a protease and the fluorophores can then be
CC detected. The present sequence is one of the peptides described in the
CC exemplification of the invention

XX PT Fluorogenic composition useful for detecting protease activity and test
XX PT substance modulating protease activity.
XX PS Disclosure; SEQ ID NO 106; 114pp; English.
XX CC The invention relates to a fluorogenic composition (I) for detecting the
XX CC activity of a protease. (I) is useful for detecting the activity of a
XX CC protease, which involves contacting the protease with (I), where the
XX CC activity of protease is detected in a histological section, cell culture
XX CC or tissue section. The cell suspension is derived from the biological
XX CC sample chosen from tissue, blood, urine, saliva, lymph or biopsy. The
XX CC protease activity is detected by fluorescence microscopy, fluorescence
XX CC microplate reader, absorption spectroscopy or confocal fluorescent microplate
XX CC reader. (I) is useful for delivering a molecule into a cell, and for
XX CC screening a test agent for the ability to modulate the activity of the
XX CC protease. (I) is useful for detection and localisation of protease
XX CC activity in biological samples. (I) also acts as a protease inhibitor,
XX CC thus useful as protease inhibitors. (I) enables detection of the protease
XX CC activity, and provides a high intensity fluorescent signal at a visible
XX CC wavelength when they are digested by a protease. The present sequence
XX CC represents a fluorogenic protease indicator peptide of the invention.

XX PS Disclosure; SEQ ID NO 1427; 645pp; English.
XX CC The invention relates to the use of at least one set of peptides in the
XX CC preparation of a medicament for modulating an immune response, where
XX CC individual peptides of a respective set comprise different portions of an
XX CC amino acid sequence corresponding to a single polypeptide of interest and
XX CC display partial sequence identity or similarity to at least one other
XX CC peptide of the same set of peptides (i.e. they are overlapping). Also
XX CC included are an antigen-presenting cell which has been contacted with the
XX CC peptides above and thus presents the peptides, a population of such
XX CC antigen-presenting cells, a process for producing antigen-presenting
XX CC cells for modulating an immune response to a polypeptide of interest, a
XX CC method for producing antigen-specific lymphocytes, a composition
XX CC comprising at least one set of the peptides (and a carrier and/or
XX CC diluent), a method for administering an immune response to a polypeptide of
XX CC interest comprising administering to a patient in need at least one set
XX CC of the peptides, a method for treatment and/or prophylaxis of a disease
XX CC or condition associated with the presence of a polypeptide of interest
XX CC and a composition of matter for modulating an immune response in a
XX CC subject to a target antigen. The polypeptide of interest is also a
XX CC disease- or condition-associated polypeptide that is a polypeptide
XX CC produced by a pathogenic organism or a cancer, and produced by a
XX CC pathogenic organism selected from yeast, viruses, bacteria, helminths,
XX CC protozoans and mycoplasmas. The disease- or condition-associated
XX CC polypeptide is produced by a cancer selected from melanoma, lung cancer,
XX CC breast cancer, cervical cancer, prostate cancer, colon cancer, pancreatic
XX CC cancer, stomach cancer, bladder cancer, kidney cancer, post transplant
XX CC lymphoproliferative disease (PTLD) or Hodgkin's Lymphoma. The uncultured
XX CC antigen-presenting cells or their precursors are useful in the
XX CC preparation of a medicament for the treatment of a disease or condition
XX CC in a subject, which disease or condition is associated with the presence
XX CC or aberrant expression of a target antigen, where the antigen-presenting
XX CC cells or their precursors have not been subjected to activating
XX CC conditions but have been contacted with an antigen that corresponds to
XX CC the target antigen to express a processed or modified form of the antigen
XX CC for presentation to the subject's immune system. The present sequence is
XX CC one of a set of overlapping immunogenic peptides derived from a Hepatitis
XX C virus protein.

CC composition which is used for the detection of protease activity in

CC biological samples. The products can be used for the detection of

CC conformational changes in nucleic acids, oligosaccharides, polysaccharides,

CC proteins, peptides, lipids, phospholipids, glycolipids, glycoproteins,

CC steroids or polymers. In addition, attachment of a hydrophobic group to a

CC molecule can be used to enhance uptake by cells. The composition is

CC composed of P = peptide comprising a protease binding site for the

CC protease, F1, F2 peptides = fluorophores where F1 is attached to the

CC amino terminal amino acid and F2 is attached to the carboxyl terminal

CC amino acid and S1, S2 peptides = when present, are peptide spacers where

CC S1, when present, is attached to the amino terminal acid, and S2, when

CC present, is attached to the carboxyl terminal amino acid

XX

PT Fluorogenic composition useful for detecting protease activity and test

PT substance modulating protease activity.

XX

PS Disclosure; SEQ ID NO 112; 114pp; English.

XX

XX The invention relates to a fluorogenic composition (I) for detecting the

CC activity of a protease. (I) is useful for detecting the activity of a

CC protease, which involves contacting the protease with (I), where the

CC activity of protease is detected in a histological section, cell culture

CC or tissue section. The cell suspension is derived from the biological

CC sample chosen from tissue, blood, urine, saliva, lymph or biopsy. The

CC protease activity is detected by fluorescence microscopy, fluorescence

CC microplate reader, absorption microplate reader, flow cytometry,

CC fluorometry, absorption spectroscopy or confocal fluorescent microplate

CC reader. (I) is useful for delivering a molecule into a cell, and for

CC screening a test agent for the ability to modulate the activity of the

CC protease. (I) is useful for detection and localisation of protease

CC activity in biological samples. (I) also acts as a protease inhibitor,

CC thus useful as protease inhibitors. (I) enables detection of the protease

CC activity, and provides a high intensity fluorescent signal at a visible

CC wavelength when they are digested by a protease. The present sequence

CC represents a fluorogenic protease indicator peptide of the invention.

XX New peptides from hepatitis C virus, useful for typing virus-specific
 PT antibodies to identify the infecting strain, are derived from immunogenic
 PT viral regions.

XX Claim 3; SEQ ID NO 11; 21pp; German.

XX This invention describes a novel peptide containing at least one
 CC immunologically active region from hepatitis C virus (HCV). The method
 CC also describes a general fractional immunosorption method for typing
 CC antibodies, directed against pathogens or autoantigens. The peptides are
 CC derived from HCV of types 1a, 1b, 2a and 2b. The peptides are used to
 CC determine antibodies against HCV, particularly for typing antibodies and
 CC thus the viral strain causing infection, e.g. to assess virulence and
 CC likely response to interferon therapy. They can also be used for
 CC diagnosis of HCV infection. The invention provides a typing method
 CC suitable for routine use, without need for complex apparatus and
 CC differentiates reliably between different antibody types. Particularly,
 CC compared with known typing methods, this method saves time, sample and
 CC reagents, since it does not require preincubation of the sample with type
 CC -heterologous peptides. Since the peptides are derived from HCV regions
 CC that are simultaneously highly immunogenic and variable, they provide
 CC better typing than known peptides.

PT hepatitis C virus patients.
PT
XX Example 1; Page 4; 9pp; Japanese.
PS
XX The invention relates to an immunoassay kit for predicting an effect of a
CC therapeutic composition, for the treatment of chronic hepatitis. The
CC method comprises: (a) a peptide having a sequence comprising at least 5

CC CONH2. These new peptides are up to 1800 times more potent than hGRF(1-
 CC 26)NH2 in stimulating growth hormone release. They do not possess Arg and
 CC Met residues at the C-terminus, thereby decreasing the cost of synthesis
 CC and enhancing their stability. They can be used: to treat growth hormone
 CC deficiency, e.g. in the elderly or in children of short stature; to
 CC stimulate tissue growth, protein metabolism, carbohydrate metabolism,
 CC lipid metabolism, mineral metabolism and connective tissue metabolism; to
 CC treat catabolic states; to stimulate immune function; to enhance natural
 CC sleep patterns; or to stimulate the growth of animals, e.g. livestock.
 CC The present sequence is one of 31 specifically claimed examples of the
 CC new variants

XX New growth hormone-releasing factor analogue peptide(s) - used to
 FT stimulate the release of growth hormone, e.g. for treating growth hormone
 FT deficiency disorders.

XX Claim 23; Page 32; 34pp; English.

XX The present peptide is a human growth hormone releasing factor (hGRF)
 CC analogue, which stimulates the release of growth hormone. It can be used,
 CC e.g. to stimulate growth in patients, tissue growth and protein,
 CC carbohydrate, mineral, lipid and connective tissue metabolism. It can
 CC also be used to treat catabolic states, stimulate immune function,
 CC enhance natural sleep patterns and stimulate animal growth, e.g.

CC livestock. The hGRF analogue does not possess an undesirable C-terminal
 CC Arg or Met residue, thereby decreasing its synthesis cost and enhancing
 CC its stability

XX Claim 23; Col 22; 12pp; English.

XX The invention relates to new variants of human growth hormone releasing
 CC factor (hGRF) which contain 23-28 amino acid residues and which differ
 CC from native hGRF at least at positions 8, 9, 16, 18, 24, 25, 27 and 28.
 CC More specifically, the new variants are of formula (R1)(R2)Al-A2-Arg-Ala-
 CC Ile-Phe-Thr-A8-A9-Al0-Arg-Al2- Val-Leu-Al5-Al6-Leu-Al8-Ala-Arg-A21-A22-
 CC Leu-A24-A25-A26-A27-A28-R3 where: Al is the D or L isomer of Tyr or His
 CC or is absent; A2 is Ala or the D or L isomer of Ala, N-Me-Ala or Arg; A8
 CC is Ala, Aib or Gly; A9 is Ala, Aib or Gly; A10 is Phe or pX-Phe, where X
 CC is OH, Me or halo; A12 is Lys or N-epsilon-Lys (X is 1-6C alkyl, 1-6C
 CC acyl, 1-6C hydroxyalkyl or 2-6C hydroxyacyl); A15, A16 and A18 are Ala,
 CC Aib or Gly; A21 is Lys or N-epsilon-Lys; A22 is Ala, Aib, Gly, Leu,
 CC Ile, Val, Nle, Nva or Abu; A24 is Ala, Aib, Gaba, Gly or His; A25 and A26
 CC are Ala, Aib, Gaba, Gly or His or are absent; A27 is Ala, Aib, Gly, Leu,
 CC Ile, Val, Nle, Nva, Abu, Gaba, beta-Ala, Ava or His or is absent; A28 is
 CC Aib, the D or L isomer of Ala, Gaba or His, or is absent; R1 and R2
 CC (which are N-terminal substituents) are H, 1-12C alkyl, 7-20C
 CC phenylalkyl, 11-20C naphthylalkyl, 1-12C hydroxyalkyl, 7-20C

CC hydroxyphenylalkyl, 11-20C hydroxynaphthylalkyl or COB1, where E1 is 1-
 CC 12C alkyl, 7-20C phenylalkyl, 11-20C naphthylalkyl, 1-12C hydroxyalkyl, 7-
 CC 20C hydroxyphenylalkyl or 11-20C hydroxynaphthylalkyl; and R3 (which is a
 CC substituent on the C-terminal carbonyl group) is OH, NH2, 1-12C alkoxy or
 CC NH-Y-CH2-Z, where Y is a 1-12C hydrocarbon group and Z is H, OH, COOH or
 CC CONH2. These new peptides are up to 1800 times more potent than hGRF(1-
 CC 26)NH2 in stimulating growth hormone release. They do not possess Arg and
 CC Met residues at the C-terminus, thereby decreasing the cost of synthesis
 CC and enhancing their stability. They can be used: to treat growth hormone
 CC deficiency, e.g. in the elderly or in children of short stature; to
 CC stimulate tissue growth, protein metabolism, carbohydrate metabolism,
 CC lipid metabolism, mineral metabolism and connective tissue metabolism; to
 CC treat catabolic states; to stimulate immune function; to enhance natural
 CC sleep patterns; or to stimulate the growth of animals, e.g. livestock.
 CC The present sequence is one of 31 specifically claimed examples of the
 CC new variants

XX New growth hormone-releasing factor analogue peptide(s) - used to
 FT stimulate the release of growth hormone, e.g. for treating growth hormone
 PT deficiency disorders.

XX Claim 22; Page 29; 34pp; English.

XX The present peptide is a human growth hormone releasing factor (hGRF)

CC analogue, which stimulates the release of growth hormone. It can be used,
 CC e.g. to stimulate growth in patients, tissue growth and protein.
 CC carbohydrate, mineral, lipid and connective tissue metabolism. It can
 CC also be used to treat catabolic states, stimulate immune function,
 CC enhance natural sleep patterns and stimulate animal growth, e.g.
 CC livestock. The hGRF analogue does not possess an undesirable C-terminal
 CC Arg or Met residue, thereby decreasing its synthesis cost and enhancing
 CC its stability. Also, in an assay to test its ability to release growth
 CC hormone from rat pituitary cells in vitro, it had a 560-fold greater
 CC potency than native hGRF(1-26)NH2

PT New synthetic polypeptides having several different segments of at least
PT one parent polypeptide linked together differently compared to the
PT linkage in the parent polypeptide, for inducing immune response against a
PT pathogen or cancer.
XX
PS Example 2; Fig 26; 364pp; English.

XX The invention relates to a new synthetic polypeptide (I) comprising
CC several different segments of at least one parent polypeptide linked
CC together in a different relationship relative to their linkage in the
CC parent polypeptide to impede, abrogate or otherwise alter at least one
CC function associated with the parent polypeptide and for inducing an
CC immune response against a pathogen or cancer. Also included are a
CC synthetic polynucleotide encoding and a computer system for designing the
CC synthetic polypeptides. The synthetic polypeptides and polynucleotides
CC are referred to as a Savine. The synthetic polypeptide is useful for
CC modulating immune responses preferably directed against a pathogen or a
CC cancer, (e.g., cancers of the lung, breast, ovary, cervix, colon, head
CC and neck, pancreas, prostate, stomach, bladder, kidney, bone liver,
CC oesophagus, brain, testicle, uterus), as potentiating agents.
CC Compositions comprising the polypeptide may be used in the treatment or
CC prophylaxis against viral (such as infections caused by HIV (human
CC immunodeficiency virus), hepatitis, influenza, Japanese encephalitis
CC virus, Epstein-Barr virus and respiratory syncytial virus), bacterial
CC (e.g., infections caused by Neisseria, Meningococcal, Haemophilus,
CC Salmonella, Streptococcal, Legionella and Mycobacterium) or parasitic
CC (e.g., infections caused by Plasmodium, Schistosoma, Leishmania,
CC Trypanosoma, Toxoplasma and Giardia) infections. The present sequence is
CC a peptide derived from a parent protein used to construct a savine of the
CC invention

XX Improving properties of peptides for use as diagnostic antigens or for
 PT preventing or treating infections.

XX PS Claim 55; Page 73; 83pp; English.

XX This is a peptide related to the immunoreactive region of the NS4 region
 CC of hepatitis C virus (HCV). The peptide is useful for detecting HCV
 CC infection. The invention relates to peptides derived from HCV and also
 CC HIV-1 which have been modified for use as diagnostic antigens in the
 CC treatment or prevention of infection. The structural stability of the
 CC peptides can be increased in four different ways; through the replacement
 CC of a hydrophobic amino acid with a less hydrophobic amino acid; through
 CC an increase in the amount of secondary structure (i.e. alpha helix) in
 CC the peptide; through the removal of a positive charge from the peptide,
 CC or through the constraint of the epitopic sequence via the formation of a
 CC covalent crosslink. Modified peptides of the invention are used to detect
 CC infectious agents specifically HCV. Other detectable agents include HIV-1
 CC Group O viruses; human T-cell lymphotropic virus-I or -II; and the
 CC causative agent of syphilis. The peptides can be used for prevention or

CC treatment of infections (e.g. as vaccines, or where expressed from a
 CC transgene). More generally almost any peptide can be similarly modified,
 CC e.g. cytokines or interferons; major histocompatibility complex antigens;
 CC hormones; growth factors; tumour markers or suppressors, or antigens from
 CC many other pathogens

XX Preparing immunogenic peptides, useful in vaccination against hepatitis C

XX virus, by convergent combinatorial synthesis from T cell epitopes.

XX Claim 7; Fig 23; 49pp; French.

XX The present invention relates to a method for preparing immunogenic
 CC peptides that correspond to restricted regions of viral proteins
 CC implicated in a T cell immune response and to libraries of convergent
 CC combinatorial peptides corresponding to the restricted regions. The
 CC peptides can be used to prepare vaccines, particularly for use in the
 CC treatment and prevention of hepatitis C virus infection. The present
 CC sequence is an immunogenic peptide derived from the hepatitis C capsid
 CC protein described in the exemplification of the invention

XX DNA fragment HC280 coding for human hepatitis C virus NS4 antigen - for
XX producing recombinant polypeptide useful in immuno:diagnosis of hepatitis
XX C.

XX Claim 2; Col 12; 6pp; Russian.

XX The present sequence is encoded by the new chemically synthesised DNA
XX fragment HC280 which determines the synthesis of recombinant polypeptide
XX HC280, capable of binding antibodies to the product of the NS4 gene of
XX human hepatitis C virus (HCV). The DNA fragment has a defined sequence of
XX 283 base pairs. The NS4 antigen is useful in immunoassays for the
XX diagnosis of human hepatitis C virus

 PT Compositions for treating and diagnosing cancer, contain agents that
 PT inhibit activity or expression of specific tumor-associated antigens, or
 PT bind to these antigens or nucleic acid encoding them.
 XX
 PS Claim 32; SEQ ID NO 86; 388pp; German.
 XX
 CC This invention relates to a novel pharmaceutical composition which
 CC comprises an agent that inhibits the activity or expression of a specific
 CC tumor-associated antigen (TAG). Specifically, it relates to tumor-
 CC associated antigens that are encoded by one of the following 75 nucleic
 CC acids sequences, fragments or derivatives thereof as given in the
 CC specification. The present invention describes antisense nucleic acids
 CC that hybridize to these TAG polynucleotides that may be used for
 CC antisense therapy and RNA interference, as well as methods for diagnosing
 CC a disease associated with (abnormal) expression of TAG. Accordingly, it
 CC further relates to methods for determining regression, progression and
 CC onset of a disease by administering an antibody, optionally linked to a
 CC therapeutic or diagnostic agent, that binds to TAG. As such, cytostatic
 CC compositions derived thereof are used for treating a wide range of
 CC cancers and their metastases, where the agents that bind specifically to
 CC TAG, and the nucleic acids that encode them, are useful for diagnosis and
 CC monitoring. This polypeptide sequence is a human tumor associated
 CC antigenic protein of the invention.

 XX Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide,
 PT useful as molecular targets for diagnostics, prophylaxis and treatment of
 PT pathological conditions resulting from bacterial infection.
 XX
 XX Disclosure; SEQ ID NO 25536; 455pp; English.
 PS
 XX The invention relates to Pseudomonas aeruginosa polypeptides and the
 CC polynucleotides encoding them. The sequences are useful in diagnosis and
 CC therapy of pathological conditions, as molecular targets for diagnostics,
 CC prophylaxis and treatment of pathological conditions resulting from a
 CC bacterial infection, for evaluating a compound, such as a polypeptide,
 CC for the ability to bind a P. aeruginosa nucleic acid, as components of
 CC effective antibacterial targets, as targets for antibacterial drugs,
 CC including anti-P. aeruginosa drugs, as templates for recombinant
 CC production of P. aeruginosa-derived peptides or polypeptides, as target
 CC components for diagnosis and/or treatment of P. aeruginosa-caused
 CC infection, and in detection of P. aeruginosa sequences or other sequences
 CC of Pseudomonas species using biochip technology. Sequences ABO67826-
 CC ABO84396 represent P. aeruginosa polypeptides of the invention. Note: The
 CC sequence data for this patent did not form part of the printed
 CC specification but was obtained in electronic format from USPTO at
 CC seqdata.uspto.gov/sequence.html

XX Example 1; Page 65; 82pp; English.
XX AAY92467-97 are C3 mutants from Tomato yellow leaf curl virus. The designations C3 and AL3 are interchangeable - viral genes are named as to whether they are specified by the virion (V) or complementary (C) sense DNA strands, or alternatively with respect to the left (L) or right (R) of the 5' intergenic region. Plants, containing transformed plant cells containing a heterologous nucleic acid construct comprising a mutant AL3/C3 protein, operably associated with a promoter and a termination sequence, are claimed. Expression of the mutant AL3/C3 protein increases resistance of the plant to infection by at least one geminivirus compared to a non-transformed control. This is especially useful for increasing the resistance of cassava, potato, bean, squash, beet or tomato plants to infection by, e.g. tomato golden mosaic virus, tomato mottle virus and tomato yellow leaf curl virus

PT improving yield.
XX
XX Claim 1; SEQ ID NO 48127; 15pp; English.
XX
XX The invention describes a recombinant DNA construct comprising a
CC polynucleotide consisting of a sequence encoding an amino acid sequence
CC available in electronic form from the US patent office at
CC ftp.segdata.uspto.gov/sequence.html?DocID:2004034888. The polynucleotide
CC of the invention are also useful in physical arrays of molecules and as
CC plant breeding markers. The recombinant DNA construct is useful for
CC improving plant tolerance to cold, heat, drought, herbicides, extreme
CC osmotic conditions, pathogens or pests, for manipulating growth rate in
CC plant cells by modification of the cell cycle pathway, for conferring
CC increased resistance to plant disease, for producing galactomannan,
CC lignin or plant growth regulators, for increasing the rate of homologous
CC recombination in plants, for improving yield by modification of
CC photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake
CC or by providing improved plant growth and development under at least one
CC stress condition or for modifying seed oil or protein yield and/or
CC content. This is the amino acid sequence of a plant full length insert
CC polypeptide that can be used in the recombinant DNA construct of the
CC invention.

 XX Novel isolated nucleic acid encoding *Pseudomonas aeruginosa* polypeptide, of
 PT useful as molecular targets for diagnostics, prophylaxis and treatment of
 PT pathological conditions resulting from bacterial infection.
 XX Disclosure; SEQ ID NO 29832; 455pp; English.
 XX The invention relates to *Pseudomonas aeruginosa* polypeptides and the
 CC polynucleotides encoding them. The sequences are useful in diagnosis and
 CC therapy of pathological conditions, as molecular targets for diagnostics, and
 CC prophylaxis and treatment of pathological conditions resulting from a
 CC bacterial infection, for evaluating a compound, such as a polypeptide,
 CC for the ability to bind a *P. aeruginosa* nucleic acid, as components of
 CC effective antibacterial targets, as targets for antibacterial drugs,
 CC including anti-*P. aeruginosa* drugs, as templates for recombinant
 CC production of *P. aeruginosa*-derived peptides or polypeptides, as target
 CC components for diagnosis and/or treatment of *P. aeruginosa*-caused
 CC infection, and in detection of *P. aeruginosa* sequences or other sequences
 CC of *Pseudomonas* species using biochip technology. Sequences ABO67826-
 CC ABO84396 represent *P. aeruginosa* polypeptides of the invention. Note: The
 CC sequence data for this patent did not form part of the printed
 CC specification but was obtained in electronic format from USPTO at
 CC seqdata.uspto.gov/sequence.html

XX XX Nucleic acids encoding 4277 human colon cancer-associated polypeptides,
PT useful for preventing, diagnosing and/or treating colorectal cancers.
XX XX Claim 11; Page 7736-7737; 9803pp; English.
XX CC AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon
CC cancer-associated nucleic acid molecules (N) and proteins (P), where the
CC proteins are collectively known as colon cancer antigens. The colon
CC cancer antigens have cytostatic activity and can be used in gene therapy
CC and vaccine production. N and P may be used in the prevention, diagnosis
CC and treatment of diseases associated with inappropriate P expression. For
CC example, N and P may be used to treat disorders associated with decreased
CC expression by rectifying mutations or deletions in a patient's genome
CC that affect the activity of P by expressing inactive proteins or to
CC supplement the patient's own production of P. Additionally, N may be used
CC to produce the colon cancer-associated Ps, by inserting the nucleic acids
CC into a host cell and culturing the cell to express the proteins. N and P
CC can be used in the prevention, diagnosis and treatment of colorectal
CC carcinomas and cancers. AAH37196 to AAH37204 and AAG77789 represent
CC sequences used in the exemplification of the present invention. N.B.
CC Pages 666 to 682 and page 7053 of the sequence listing were missing at
CC time of publication, meaning no sequences are present for SEQ ID NO:1027
CC to 1052, 7921 and 7922

PT Novel fetal proteins useful for the treatment and diagnosis of diseases
PT associated with dysfunction of the protein e.g. cancers, immune
PT disorders, growth disorders, thrombolytic disorders, nervous system
PT disorders and inflammation.
XX
PS Claim 10; Page 326; 715pp; English.
XX
CC The invention relates to novel foetal polypeptides encoded by
CC polynucleotides comprising one of 477 sequences fully defined in the
CC specification. The foetal polynucleotides and polypeptides are useful in
CC the treatment and diagnosis of diseases such as cancers, immune
CC disorders, growth disorders (e.g. osteoporosis), thrombolytic disorders,
CC nervous system disorders and inflammation. The present sequence is a
CC polypeptide encoded by a cDNA assembled using an expressed sequence tag
CC (EST) found to be expressed in human foetal tissue cDNA libraries

PT New recombinant DNA construct, useful for improving plant tolerance to
PT cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or
PT pests, for conferring increased resistance to plant disease, or for
PT improving yield.
XX
PS Claim 1; SEQ ID NO 56940; 15pp; English.
XX
CC The invention describes a recombinant DNA construct comprising a
CC polynucleotide consisting of a sequence encoding an amino acid sequence
CC available in electronic form from the US patent office at
CC ftp.secdatasupto.gov/sequence.html?DocID:2004034888. The polynucleotide
CC of the invention are also useful in physical arrays of molecules and as
CC plant breeding markers. The recombinant DNA construct is useful for
CC improving plant tolerance to cold, heat, drought, herbicides, extreme
CC osmotic conditions, pathogens or pests, for manipulating growth rate in
CC plant cells by modification of the cell cycle pathway, for conferring
CC increased resistance to plant disease, for producing galactomannan,
CC lignin or plant growth regulators, for increasing the rate of homologous
CC recombination in plants, for improving yield by modification of
CC photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake
CC or by providing improved plant growth and development under at least one
CC stress condition or for modifying seed oil or protein yield and/or
CC content. This is the amino acid sequence of a plant full length insert
CC polypeptide that can be used in the recombinant DNA construct of the
CC invention.

XX
XX Fas Apoptosis Inhibitory Molecule (FAIM) oligonucleotides and proteins.
XX
XX Disclosure; Fig 2J; 43pp; English.
XX
XX The invention relates to nucleic acid sequences from the Fas Apoptosis
CC Inhibitory Molecule (FAIM) gene, and the encoded proteins. The proteins
CC prevent apoptosis in Bal-17 B lymphoma cells and various murine cells.
CC Host cells expressing one of the FAIM nucleic acid sequence are used for
CC screening for compounds that alter FAIM activity. These compounds are
CC useful for modulating apoptosis. The antibodies (and any fusion proteins
CC produced) are useful for identifying novel FAIM pathway constituents and
CC FAIM homologs. The antibodies are also useful for determining the level
CC of FAIM expression in various cell types. FAIM inhibits apoptosis when
CC the gene is expressed ectopically. The present sequence represents the
CC amino acid sequence of short murine FAIM

XX
XX New recombinant DNA construct, useful for improving plant tolerance to
PT cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or
PT pests, for conferring increased resistance to plant disease, or for
PT improving yield.
XX
XX Claim 1; SEQ ID NO 47789; 15pp; English.
XX
XX The invention describes a recombinant DNA construct comprising a
CC polynucleotide consisting of a sequence encoding an amino acid sequence
CC available in electronic form from the US patent office at
CC ftp.segdata.uspto.gov/sequence.html?DocID:2004034888. The polynucleotide
CC of the invention are also useful in physical arrays of molecules and as
CC plant breeding markers. The recombinant DNA construct is useful for
CC improving plant tolerance to cold, heat, drought, herbicides, extreme
CC osmotic conditions, pathogens or pests, for manipulating growth rate in
CC plant cells by modification of the cell cycle pathway, for conferring
CC increased resistance to plant disease, for producing galactomannan,
CC lignin or plant growth regulators, for increasing the rate of homologous
CC recombination in plants, for improving yield by modification of
CC photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake
CC or by providing improved plant growth and development under at least one
CC stress condition or for modifying seed oil or protein yield and/or
CC content. This is the amino acid sequence of a plant full length insert
CC polypeptide that can be used in the recombinant DNA construct of the
CC invention.

XX Fas Apoptosis Inhibitory Molecule (FAIM) oligonucleotides and proteins.

PS Disclosure; Fig 2L; 43pp; English.

XX The invention relates to nucleic acid sequences from the Fas Apoptosis
CC Inhibitory Molecule (FAIM) gene, and the encoded proteins. The proteins
CC prevent apoptosis in Bal-17 B lymphoma cells and various murine cells.
CC Host cells expressing one of the FAIM nucleic acid sequence are used for
CC screening for compounds that alter FAIM activity. These compounds are
CC useful for modulating apoptosis. The antibodies (and any fusion proteins
CC produced) are useful for identifying novel FAIM pathway constituents and
CC FAIM homologs. The antibodies are also useful for determining the level
CC of FAIM expression in various cell types. FAIM inhibits apoptosis when
CC the gene is expressed ectopically. The present sequence represents the
CC amino acid sequence of long murine FAIM

PT Novel nucleic acid fragment which codes for non-A-non-B type hepatitis
PT virus antigen, useful for diagnosing hepatitis C virus infection in a
PT patient.

XX Disclosure; Page 45-46; 59pp; Japanese.

CC This invention relates to a novel nucleic acid fragment containing a
CC nucleotide sequence which codes for non-A-non-B type hepatitis virus
CC antigen which has a fully defined sequence of 273 or 330 amino acids as
CC given in the specification. The invention is useful for producing non-A-
CC non-B type hepatitis virus antigen by recombinant techniques. The
CC invention may therefore be useful for diagnosing hepatitis C virus
CC infection in a patient and thus helping in prevention of the disease. The
CC invention allows effective detection of non-A-non-B hepatitis patients.
CC The present sequence is that of a non-A-non-B type hepatitis virus
CC antigen encoded by a DNA sequence of the invention. Note: This sequence
CC appears embedded within a cDNA sequence in the sequence listing of the
CC specification.

PT New isolated nucleic acid encoding a *Streptococcus pneumoniae*
PT polypeptide, useful for diagnosing, preventing and/or treating
PT pathological conditions resulting from the bacterial infection.

XX Disclosure; SEQ ID NO 3655; 151pp; English.

CC The invention relates to an isolated nucleic acid comprising a sequence
CC encoding a *Streptococcus pneumoniae* ADR91366polypeptide, or its
CC fragments, with any of 9 fully defined sequences (appearing as ADR94308,
CC ADR94489, ADR94800, ADR94837, ADR94969, ADR95253, ADR95642, ADR95682,
CC ADR96079) or any of the fully defined sequences appearing as ADR91705,
CC ADR91886, ADR92197, ADR92234, ADR93039, ADR93079, ADR92366, ADR92650 or
CC ADR93476 or at least 20 or 30 consecutive nucleotides of the nucleotide
CC sequences, or at least 40, 60 or 300 consecutive nucleotides, which is
CC hybridisable under high stringency conditions to the nucleotide sequences.
CC The nucleic acids and proteins are chosen from 5206 disclosed sequences.
CC Also included are a recombinant expression vector comprising the isolated
CC nucleic acid cited above operably linked to a transcription regulatory
CC element, a cell comprising the recombinant expression vector and a probe
CC comprising at least 20 consecutive nucleotides of the nucleotide
CC sequences as cited above. The methods and compositions of the present
CC invention are useful for the diagnosis, prevention and/or treatment of
CC pathological conditions resulting from bacterial infection by
CC *Streptococcus pneumoniae* e.g. pneumonia, bacteraemia, meningitis and
CC otitis media. The present sequence is one of the 2603 disclosed *S.*
CC *pneumoniae* protein sequences. Note: The sequence data for this patent did
CC not form part of the printed specification, but was obtained in
CC electronic format directly from USPTO at
CC seqdata.uspto.gov/sequence.html?docID=6800744B1.

XX New isolated nucleic acid molecules and encoded polypeptides useful for
diagnosing, preventing or treating bacterial infections, particularly
Streptococcus pneumoniae infection.
XX Claim 5; SEQ ID NO 3655; 144pp; English.
XX The invention relates to an isolated nucleic acid molecule for detecting,
preventing or treating pathological conditions resulting from bacterial
infection. The isolated nucleic acid comprises: (a) any of the 2603
nucleotide sequences of AEA55236 to AEA57838; (b) a nucleotide sequence
encoding a Streptococcus pneumoniae polypeptide comprising any of the
2603 amino acid sequences of AEA57839 to AEA60441; or (c) a nucleotide
sequence of at least 8 nucleotides in length, where the sequence is
hybridizable to a nucleic acid having any of the nucleotide sequences in
(a). Also described: (1) a recombinant expression vector comprising the
above nucleic acid operably linked to a transcription regulatory element;
(2) a cell comprising the recombinant expression vector; (3) producing an
S. pneumoniae polypeptide; (4) a probe comprising a nucleotide sequence
consisting of at least 8 nucleotides of any of AEA55236 to AEA57838; (5)
treating a subject for S. pneumoniae infection; (6) a recombinant or
substantially pure preparation of an S. pneumoniae polypeptide or its
fragment, where the polypeptide is selected from AEA57839 to AEA60441;
(7) a vaccine composition for preventing or treating an S. pneumoniae
infection, comprising an amount of the above nucleic acid or polypeptide;
(8) detecting the presence of a Streptococcus nucleic acid in a sample;
(9) a computer readable medium having recorded the nucleotide sequences
of AEA55236 to AEA57838; (10) a computer based system for identifying
fragments of the Streptococcus genome of commercial importance. The
composition and methods are useful for diagnosing, preventing or treating
bacterial infections, particularly S. pneumoniae infection. The present
sequence represents a S. pneumoniae ORF amino acid sequence from the
present invention. Note - The sequence data for this patent did not form
part of the printed specification, but was obtained in electronic format
directly from the USPTO web site.

XX New recombinant DNA construct, useful for improving plant tolerance to
cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or
pests, for conferring increased resistance to plant disease, or for
improving yield.
XX Claim 1; SEQ ID NO 46547; 15pp; English.
XX The invention describes a recombinant DNA construct comprising a
polynucleotide consisting of a sequence encoding an amino acid sequence
available in electronic form from the US patent office at
ftp.segdata.uspto.gov/sequence.html?docid:2004034888. The polynucleotide
of the invention are also useful in physical arrays of molecules and as
plant breeding markers. The recombinant DNA construct is useful for
improving plant tolerance to cold, heat, drought, herbicides, extreme
osmotic conditions, pathogens or pests, for manipulating growth rate in
plant cells by modification of the cell cycle pathway, for conferring
increased resistance to plant disease, for producing galactomannan,
lignin or plant growth regulators, for increasing the rate of homologous
recombination in plants, for improving yield by modification of
photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake
or by providing improved plant growth and development under at least one
stress condition or for modifying seed oil or protein yield and/or

CC content. This is the amino acid sequence of a plant full length insert
CC polypeptide that can be used in the recombinant DNA construct of the
CC invention.

XX Designing a candidate polypeptide for expression in a host, useful for
PT preventing or treating e.g. HIV, comprises identifying hydrophobic
PT peptide sequences in the polypeptide and arranging or re-locating the
PT peptide sequences.
XX
XX Disclosure; SEQ ID NO 102; 98pp; English.
XX
XX This invention relates to a novel method for designing heterologous
CC polypeptides comprising a proportion of hydrophobic amino acids that
CC increases the probability of the protein being efficiently expressed in a
CC bacterial host system. Specifically, it refers to arranging or re-
CC locating a hydrophobic peptide sequence within the protein of interest in
CC order to generate a candidate protein with reduced amplitude in
CC hydrophobicity and/ or length of any hydrophobic region. The present
CC invention describes using these polypeptides for use in a polypeptide
CC vaccine that is capable of eliciting a cytotoxic T-cell lymphocyte immune
CC response. As such, compositions can be used for the prevention or
CC treatment of diseases associated with the Epstein-Barr virus (EBV) such
CC as infectious mononucleosis or nasopharyngeal carcinoma, as well as
CC hepatitis C virus, cytomegalovirus or HIV. Accordingly, they exhibit
CC virucidal, cytostatic, hepatotropic, antiinflammatory and anti-HIV
CC activities. This polypeptide sequence is an HCV polypeptide protein
CC (HCVb) of the invention.

CC

CC protein or BD127 1 6 protein. The polynucleotides are useful for
 CC expressing recombinant proteins for analysis and are also useful as
 CC chromosome markers or tags to identify chromosomes or to map related gene
 CC positions. The proteins are useful as amino acid supplement, carbon
 CC source, nitrogen source and carbohydrate source. The proteins are useful
 CC for treating various immune deficiencies and disorders (e.g. severe
 CC combined immunodeficiency (SCID)), autoimmune disorders (e.g. multiple
 CC sclerosis, systemic lupus erythematosus, rheumatoid arthritis), allergic
 CC reactions (e.g. asthma), myeloid or lymphoid cell deficiencies,
 CC osteoporosis or osteoarthritis, peripheral nervous system diseases (e.g.
 CC peripheral neuropathy, Alzheimer's disease, Parkinson's disease),
 CC coagulation disorders, inflammatory diseases (e.g. systemic inflammatory
 CC response syndrome (SIRS), ischaemia-reperfusion injury, Crohn's disease),
 CC anaphylaxis and hypersensitivity. Proteins are also useful for inducing
 CC tumour immunity, for inducing bone, cartilage, tendon, ligament and/or
 CC nerve growth or regeneration, for proliferating neural cells and for
 CC regenerating nerve and brain tissue, for inducing fertility and for
 CC inhibiting tumour growth. Proteins are also useful as chemokine for
 CC mammalian cells (e.g., monocytes, fibroblasts, neutrophils), and also
 CC useful as inhibitors of receptor/ligand interactions. The present
 CC sequence represents the amino acid sequence of a human secreted protein.

 XX
 XX Claim 25; SEQ ID NO 50761; 1766pp; English.

CC The invention relates to an isolated nucleic acid comprising any one of
 CC the 6213 antisense sequences given in the specification where expression
 CC of the nucleic acid inhibits proliferation of a cell. Also included are:
 CC (1) a vector comprising a promoter operably linked to the nucleic acid
 CC encoding a polypeptide whose expression is inhibited by the antisense
 CC nucleic acid; (2) a host cell containing the vector; (3) an isolated
 CC polypeptide or its fragment whose expression is inhibited by the
 CC antisense nucleic acid; (4) an antibody capable of specifically binding
 CC the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
 CC proliferation or the activity of a gene in an operon required for
 CC proliferation; (7) identifying a compound that influences the activity of
 CC the gene product or that has an activity against a biological pathway
 CC required for proliferation, or that inhibits cellular proliferation; (8)
 CC identifying a gene required for cellular proliferation or the biological
 CC pathway in which a proliferation-required gene or its gene product lies
 CC or a gene on which the test compound that inhibits proliferation of an
 CC organism acts; (9) manufacturing an antibiotic; (10) profiling a
 CC compound's activity; (11) a culture comprising strains in which the gene
 CC product is overexpressed or underexpressed; (12) determining the extent
 CC to which each of the strains is present in a culture or collection of
 CC strains; or (13) identifying the target of a compound that inhibits the
 CC proliferation of an organism. The antisense nucleic acids are useful for
 CC identifying proteins or screening for homologous nucleic acids required
 CC for cellular proliferation to isolate candidate molecules for rational
 CC drug discovery programs, or for screening homologous nucleic acids
 CC required for proliferation in cells other than *S. aureus*, *S. typhimurium*,
 CC *K. pneumoniae* or *P. aeruginosa*. The present sequence is encoded by one of
 CC the target prokaryotic essential genes. Note: The sequence data for this
 CC patent did not form part of the printed specification, but was obtained
 CC in electronic format directly from WIPO at

PT Propionibacterium acnes polypeptides and nucleic acids useful for
PT vaccinating against and diagnosing infections, especially useful for
PT treating acne vulgaris.
XX
PS Example 1; SEQ ID NO 26057; 1069pp; English.
XX
CC Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic
CC polypeptides. The proteins and their associated DNA sequences are used in
CC the treatment, prevention and diagnosis of medical conditions caused by
CC P. acnes. The disorders include SAPHO syndrome (synovitis, acne,
CC pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis.
CC P. acnes is also involved in infections of bone, joints and the central
CC nervous system, however it is particularly involved in the inflammatory
CC lesions associated with acne vulgaris. A method for detecting the
CC presence or absence of P. acnes in a patient comprises contacting a
CC sample with a binding agent that binds to the proteins of the invention
CC and determining the amount of bound protein in the sample. The
CC polypeptides may be used as antigens in the production of antibodies
CC specific for P. acnes proteins. These antibodies can be used to
CC downregulate expression and activity of P. acnes polypeptides and
CC therefore treat P. acnes infections. The antibodies may also be used as
CC diagnostic agents for determining P. acnes presence, for example, by
CC enzyme linked immunosorbent assay (ELISA). Note: The sequence data for
CC this patent did not form part of the printed specification, but was
CC obtained in electronic format directly from WIPO at
XX ftp.wipo.int/pub/published_pct_sequences

XX PT polypeptide, useful for diagnosing, preventing or treating acne vulgaris,
XX PT or for stimulating an immune response specific for a P. acnes protein.
XX
XX PS Example 1; SEQ ID NO 26057; 1481pp; English.
XX
XX CC The invention relates to an isolated polynucleotide (ACF64435-ACF64733)
XX CC encoding a Propionibacterium acnes protein. The invention also relates to
XX CC polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to
XX CC immunogenic fragments of P. acnes polypeptides. The invention
XX CC additionally encompasses expression vectors and host cells comprising a
XX CC polynucleotide of the invention; antibodies against polypeptides of the
XX CC invention; fusion proteins comprising a polypeptide of the invention; a
XX CC method for stimulating an immune response specific for a P. acnes
XX CC polypeptide and an isolated T cell population comprising T cells prepared
XX CC via this method; a vaccine composition (comprising P. acnes polypeptides,
XX CC polynucleotides, antibodies, fusion proteins, T cell populations, or
XX CC antigen-presenting cells that express the polypeptide); a method and kit
XX CC for detecting or determining the presence or absence of P. acnes in a
XX CC patient; and a method for inhibiting the development of P. acnes in a
XX CC patient. The P. acnes polypeptides, polynucleotides, antibodies, fusion
XX CC proteins, T cell populations or antigen-presenting cells that express the
XX CC polypeptides are useful for diagnosing, preventing or treating acne
XX CC vulgaris, or for stimulating an immune response specific for a P. acnes
XX CC protein. The polynucleotides can also be used as probes or primers for
XX CC nucleic acid hybridisation. The vaccine composition is useful for the
XX CC stimulation of an immune response against P. acnes, or for treating acne,
XX CC and the kit is useful for performing a diagnostic assay. The present
XX CC sequence represents a polypeptide predicted to be encoded by an ORF (open
XX CC reading frame) contained within the P. acnes polynucleotides of the
XX CC invention. Note: The sequence data for this patent did not form part of
XX CC the printed specification, but was obtained in electronic format directly
XX CC from WIPO at ftp.wipo.int/pub/published_pct_sequences

Claim 11; Page 40-41; Opp; English.
The invention relates to a composition comprising ribavirin and an
antigen, where the antigen is derived from a hepatitis virus. The vaccine
is useful in enhancing the immune response to a hepatitis C antigen where
the composition is delivered to an animal identified as requiring an
enhanced immune response. The vaccine is useful in the treatment and
prevention of hepatitis C infection. The present sequence is Hepatitis C
virus NS4B protein

PT isolate candidate molecules for rational drug discovery programs.
XX
PS Claim 25; SEQ ID NO 71090; 1766pp; English.
XX
CC The invention relates to an isolated nucleic acid comprising any one of
CC the 6213 antisense sequences given in the specification where expression
CC of the nucleic acid inhibits proliferation of a cell. Also included are:
CC (1) a vector comprising a promoter operably linked to the nucleic acid
CC encoding a polypeptide whose expression is inhibited by the antisense
CC nucleic acid; (2) a host cell containing the vector; (3) an isolated
CC polypeptide or its fragment whose expression is inhibited by the
CC antisense nucleic acid; (4) an antibody capable of specifically binding
CC the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
CC proliferation or the activity of a gene in an operon required for
CC proliferation; (7) identifying a compound that influences the activity of
CC the gene product or that has an activity against a biological pathway
CC required for proliferation, or that inhibits cellular proliferation; (8)
CC identifying a gene required for cellular proliferation or the biological
CC pathway in which a proliferation-required gene or its gene product lies
CC or a gene on which the test compound that inhibits proliferation of an
CC organism acts; (9) manufacturing an antibiotic; (10) profiling a
CC product is overexpressed or underexpressed; (12) determining the extent
CC to which each of the strains is present in a culture or collection of
CC strains; or (13) identifying the target of a compound that inhibits the
CC proliferation of an organism. The antisense nucleic acids are useful for
CC identifying proteins or screening for homologous nucleic acids required
CC for cellular proliferation to isolate candidate molecules for rational
CC drug discovery programs, or for screening homologous nucleic acids
CC required for proliferation in cells other than *S. aureus*, *S. typhimurium*,
CC *K. pneumoniae* or *P. aeruginosa*. The present sequence is encoded by one of
CC the target prokaryotic essential genes. Note: The sequence data for this
CC patent did not form part of the printed specification, but was obtained
CC in electronic format directly from WIPO at

XX
XX New first nucleic acid molecule comprising a polynucleotide sequence,
PT given in the specification, useful in preparing a composition for
PT diagnosing or treating e.g., cancer, psoriasis or ulcerative colitis.
XX
XX Claim 14; SEQ ID NO 1148; 291pp; English.
XX
XX The invention describes a new first nucleic acid molecule comprising a
CC polynucleotide sequence given in the specification. Also described are:
CC an animal injected with the nucleic acid molecule; a second nucleic acid
CC molecule comprising a second polynucleotide sequence that is at least
CC about 70, 80, 90 or 95% homologous to the first nucleic acid molecule or
CC that hybridises to the first polynucleotide sequence under high
CC stringency conditions; a vector comprising the nucleic acid molecule and
CC a promoter that drives the expression of the nucleic acid molecule; a
CC host cell transformed, transfected, transduced or infected with the
CC nucleic acid molecule; a nucleic acid composition comprising a carrier or
CC a buffer and one or more compositions comprising the nucleic acid
CC molecule, vector or host cell; a substantially purified polypeptide; an
CC animal injected with the polypeptide; a polypeptide composition
CC comprising the polypeptide molecule and a carrier or buffer; a cell
CC culture medium comprising the polypeptide or transfected cells
CC transfected with the polynucleotide; making a transformed, transfected,
CC transduced, or infected host cell; synthesising Nanodiscs simultaneously
CC and for synthesising a series of simultaneously-synthesised Nanodiscs
CC sequentially utilising a dynamic system; preparing a hydrophobic protein
CC for determination of crystal structure; immunising a non-human animal;
CC screening for modulators of hydrophobic protein activity; a diagnostic
CC kit; determining the presence of the nucleic acid molecule or its
CC complement; determining the presence of an antibody to the polypeptide in
CC a sample; an antibody specifically recognising, binding to or modulating
CC the biological activity of at least one polypeptide encoded by a nucleic
CC acid molecule or its biologically active fragment; an antibody
CC composition comprising the antibody and a carrier; a bacteriophage, where
CC the antibody is displayed on the bacteriophage; a bacterial cell
CC comprising the bacteriophage; a non-human animal injected with the
CC antibody composition; a host cell that secretes the antibody; making an
CC antibody; diagnosing a disease, disorder, syndrome, or condition
CC comprising cancer, or proliferative, inflammatory, immune, metabolic,
CC bone, CNS, genetic, bacterial and viral diseases, disorders, syndromes or
CC conditions in a patient; a modulator composition comprising a modulator
CC and a carrier; gene therapy; prophylactic or therapeutic treatment of a
CC subject; an isolated modified cell comprising at least one first
CC heterologous nucleic acid molecule, where the first heterologous nucleic
CC acid molecule comprises a first polynucleotide sequence that encodes a
CC first polypeptide; a non-human animal deficient in the polypeptide or
CC that over-expresses the polypeptide; isolated tissues derived from the
CC non-human animal; and one or more cells derived from the non-human
CC animal. The nucleic acid is useful in preparing a composition for
CC diagnosing or treating e.g., cancer, psoriasis or ulcerative colitis.

CC This is the amino acid sequence of a novel human polypeptide of the
CC invention.

PT Detecting Hepatitis C Virus NS4B protein modulators - useful to treat

XX infection with viruses of the Flaviviridae family.

XX

PS Claim 6; Page 21-22; 27pp; English.

XX

This sequence is used in a novel method for identifying a compound that
alters activity of Hepatitis C Virus (HCV) NS4B protein. HCV NS4B
modulators can be used as antiviral compounds and as therapeutic agents
to treat viruses of the Flaviviridae family, including HCV, yellow fever
virus, Dengue viruses types 1-4, and pestiviruses such as bovine viral
diarrhoea virus and classic swine fever. Treatment of an HCV-infected
human with a HCV1 NS4B antagonist, and treatment of an HCV-infected
mammal with a HCV NS4B agonist is claimed

 XX New crystal of glutamate racemase, useful for treating bacterial
 PT infection, e.g. endocarditis, wound infection, respiratory tract
 PT infection, including sinusitis, otitis media, bacterial meningitis,
 PT peptic ulcer, or gastric MALT.
 XX Claim 21; SEQ ID NO 48; 1125pp; English.
 XX The present invention provides the crystal structure of glutamate
 CC racemase (Muri) complexed with an inhibitor and a substrate. The Muri
 CC inhibitor is useful for treating bacterial infection. The crystal,
 CC methods of identifying its inhibitors, compositions and vaccines
 CC containing the inhibitors are useful for treating bacterial infection,
 CC e.g. endocarditis, wound infection, respiratory tract infection,
 CC including sinusitis, otitis media, bacterial meningitis, peptic ulcer, or
 CC gastric MALT. The present sequence is a Muri protein.

DR
XX
XX DNA involved in streptogramin antibiotic biosynthesis - for prodn. or bio
PT -conversion of streptogramin(s) or prodn. of streptogramin intermediates,
PT derivs. or hybrid antibiotics.
XX
XX Claim 21; Page 52-53; 83pp; French.
XX
XX The snabB gene product is involved in the biosynthesis of streptogramins,
CC antibiotics active against Gram-positive bacteria. The identification of
CC the sequences encoding the enzymes involved in the biosynthetic pathway
CC means that they can be isolated and manipulated. Mutant microorganisms in
CC which a step in the streptogramin biosynthetic pathway is blocked can be
CC cultured to produce streptogramin intermediates, which may later be
CC converted to streptogramin derivatives. Recombinant cells may also be
CC used for the bioconversion of streptogramins from one form to another or
CC for the production of hybrid antibiotics. (Updated on 25-MAR-2003 to
CC correct FN field.)

PT New antisense nucleic acids, useful for identifying proteins or screening
PT for homologous nucleic acids required for cellular proliferation to
PT isolate candidate molecules for rational drug discovery programs.
XX
PS Claim 25; SEQ ID NO 57733; 1766pp; English.
XX
CC The invention relates to an isolated nucleic acid comprising any one of
the 6213 antisense sequences given in the specification where expression
```

CC of the nucleic acid inhibits proliferation of a cell. Also included are:
 CC (1) a vector comprising a promoter operably linked to the nucleic acid
 CC encoding a polypeptide whose expression is inhibited by the antisense
 CC nucleic acid; (2) a host cell containing the vector; (3) an isolated
 CC polypeptide or its fragment whose expression is inhibited by the
 CC antisense nucleic acid; (4) an antibody capable of specifically binding
 CC the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
 CC proliferation or the activity of a gene in an operon required for
 CC proliferation; (7) identifying a compound that influences the activity of
 CC the gene product or that has an activity against a biological pathway
 CC required for proliferation, or that inhibits cellular proliferation; (8)
 CC identifying a gene required for cellular proliferation or the biological
 CC pathway in which a proliferation-required gene or its gene product lies
 CC or a gene on which the test compound that inhibits proliferation of an
 CC organism acts; (9) manufacturing an antibiotic; (10) profiling a
 CC compound's activity; (11) a culture comprising strains in which the gene
 CC product is overexpressed or underexpressed; (12) determining the extent
 CC to which each of the strains is present in a culture or collection of
 CC strains; or (13) identifying the target of a compound that inhibits the
 CC proliferation of an organism. The antisense nucleic acids are useful for
 CC identifying proteins or screening for homologous nucleic acids required
 CC for cellular proliferation to isolate candidate molecules for rational
 CC drug discovery programs, or for screening homologous nucleic acids
 CC required for proliferation in cells other than *S. aureus*, *S. typhimurium*,
 CC *K. pneumoniae* or *P. aeruginosa*. The present sequence is encoded by one of
 CC the target prokaryotic essential genes. Note: the sequence data for this
 CC patent did not form part of the printed specification, but was obtained
 CC in electronic format directly from WIPO at
 CC ftp.wipo.int/pub/published_pct_sequences

XX New recombinant DNA construct, useful for improving plant tolerance to
 PT cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or
 PT pests, for conferring increased resistance to plant disease, or for
 PT improving yield.

XX Claim 1; SEQ ID NO 58726; 15pp; English.

XX The invention describes a recombinant DNA construct comprising a
 CC polynucleotide consisting of a sequence encoding an amino acid sequence
 CC available in electronic form from the US patent office at
 CC ftp.segdata.uspto.gov/sequence.html?DocID:2004034888. The polynucleotide
 CC of the invention are also useful in physical arrays of molecules and as
 CC plant breeding markers. The recombinant DNA construct is useful for
 CC improving plant tolerance to cold, heat, drought, herbicides, extreme
 CC osmotic conditions, pathogens or pests, for manipulating growth rate in
 CC plant cells by modification of the cell cycle pathway, for conferring
 CC increased resistance to plant disease, for producing galactomannan,
 CC lignin or plant growth regulators, for increasing the rate of homologous
 CC recombination in plants, for improving yield by modification of
 CC photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake
 CC or by providing improved plant growth and development under at least one
 CC stress condition or for modifying seed oil or protein yield and/or
 CC content. This is the amino acid sequence of a plant full length insert
 CC polypeptide that can be used in the recombinant DNA construct of the
 CC invention.

XX Method for disrupting targeted gene in genome of organism particularly
PT thermotable bacterium and with genome chips for analysis, applicable in
PT studying gene structure and functions.
XX
XX Claim 9; SEQ ID NO 552; 598pp; Japanese.
PS
XX
XX This invention relates to a novel method for targeting disruption of an
CC arbitrary gene in a genome of an organism which comprises providing the
CC whole sequential data of the genome of such organism, selecting at least
CC 1 arbitrary region in the sequence, providing a vector that contains a
CC sequence homologous with the selected region and a marker gene.
CC transformation, and homologous recombination. The genome is preferably
CC the genome of a hyperthermostable archaeobacterium, particularly
CC Thermococcus kodakaraensis KOD1. The method is for targeting the
CC disruption of a gene in the genome of an organism, which is applicable in
CC studying gene structure and functions as well as enzyme activities of
CC encoded proteins and useful in medicine, forensic science, food or drug
CC inspection, molecular biology and immunology. With this method, the
CC disruption of a gene at an arbitrary position in a genome can be achieved
CC efficiently and reliably. The present sequence is that of a protein
CC encoded by the genome of Thermococcus kodakaraensis which was derived
CC using the method of the invention. Note: The sequence data for this
CC patent did not form part of the printed specification, but was obtained
CC in electronic format directly from WIPO at
CC ftp.wipo.int/pub/published_pct_sequences

PT Identifying nucleotide or polypeptide sequence for use as drug target,
PT involves providing algorithm that analyzes a functional relationship
PT between nucleotide or polypeptide sequences, and comparing the sequences.
XX
PS Disclosure; Page 165; 207pp; English.
XX
SQ This invention relates to a method for identifying a nucleotide or
CC polypeptide sequence that may be a drug target, or essential for growth
CC or viability of an organism. Polynucleotide sequences AAH51947 - AAH52092
CC represent DNA encoding proteins AAG81096 - AAG81241, Mycobacterium
CC tuberculosis proteins which are potential drug targets. The DNA and
CC protein sequences are used to illustrate the method of the invention. The
CC method involves providing an unknown nucleotide or polypeptide sequences,
CC and comparing it to a number of sequences along with at least one
CC algorithm capable of analysing a functional relationship between
CC nucleotide and polypeptide sequences. The method is useful for
CC characterising the function of nucleic acids and polypeptides that may be
CC useful as a target for a drug or essential for the growth or viability of
CC an organism

XX Primer sets for synthesizing polynucleotides, particularly the 5602 full-
XX length cDNAs defined in the specification, and for the detection and/or
XX diagnosis of the abnormality of the proteins encoded by the full-length
XX cDNAs.
XX Claim 8; SEQ ID NO 16058; 2537pp + Sequence Listing; English.
XX The present invention describes primer sets for synthesizing 5602 full-
XX length cDNAs defined in the specification. Where a primer set comprises:
XX (a) an oligo-dT primer and an oligonucleotide complementary to the
XX complementary strand of a polynucleotide which comprises one of the 5602
XX nucleotide sequences defined in the specification, where the
XX oligonucleotide comprises at least 15 nucleotides; or (b) a combination
XX of an oligonucleotide comprising a sequence complementary to the
XX complementary strand of a polynucleotide which comprises a 5'-end
XX sequence and an oligonucleotide comprising a sequence complementary to a
XX polynucleotide which comprises a 3'-end sequence, where the
XX oligonucleotide comprises at least 15 nucleotides and the combination of
XX the 5'-end sequence/3'-end sequence is selected from those defined in the
XX specification. The primer sets can be used in antisense therapy and in
XX gene therapy. The primers are useful for synthesizing polynucleotides,
XX particularly full-length cDNAs. The primers are also useful for the
XX detection and/or diagnosis of the abnormality of the proteins encoded by
XX the full-length cDNAs. The primers allow obtaining of the full-length
XX cDNAs easily without any specialised methods. AAHQ3166 to AAH13628 and
XX AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to AAB95893

 PT New polynucleotides, useful for expressing recombinant proteins for
 analysis, characterization or therapeutic use, or as markers for tissues
 in which the corresponding protein is preferentially expressed.
 XX Claim 20; SEQ ID NO 1198; 1177pp; English.
 PS The invention comprises the amino acid and coding sequences of novel
 proteins. The DNA and protein sequences of the invention are useful as:
 CC markers for tissues in which the corresponding protein is preferentially
 expressed; as molecular weight markers on gels; as chromosome markers or
 CC tags; to identify chromosomes or to map related gene positions; and to
 CC compare with endogenous DNA sequences in patients to identify potential
 genetic disorders. The present amino acid sequence represents a protein
 CC of the invention.

XX
XX New recombinant DNA construct comprising a promoter positioned to provide
XX for expression of a polynucleotide encoding a polypeptide from a
XX microbial source, useful for producing plants with improved properties.
XX
XX Claim 1; SEQ ID NO 9352; 122pp; English.
XX
XX The invention relates to a recombinant DNA construct comprising a
XX promoter functional in a plant cell, where the promoter is positioned to
XX provide for expression of a polynucleotide encoding a polypeptide from a
XX microbial source. The invention also relates to a transformed plant
XX comprising the recombinant DNA construct and a method of producing a
XX transformed plant having an improved property. The plant is a crop plant
XX such as maize or soybean. The method of producing a transformed plant
XX having an improved property comprises transforming a plant with the
XX recombinant DNA construct and growing the transformed plant, where the
XX polynucleotide or polypeptide is useful for improving plant properties.
XX The recombinant DNA construct is useful for producing plants with
XX improved plant properties, e.g. improved cold, heat or drought tolerance,
XX tolerance to herbicides, extreme osmotic conditions, pathogens or pests,
XX increased resistance to plant disease, better growth rate by modification
XX of the cell cycle pathway with plant growth regulators, increased rate of
XX homologous recombination, modified seed oil or protein yield and/or
XX content, improved yield by modification of carbohydrate, nitrogen or
XX phosphorus use and/or uptake, by modification of photosynthesis or by
XX providing improved plant growth and development under at least one stress
XX condition, improved lignin production or improved galactomannan
XX production. This sequence represents a bacterial polypeptide used in the
XX scope of the invention. Note: The sequence data for this patent did not
XX form part of the printed specification but was obtained in electronic
XX format from USPTO at seqdata.uspto.gov/sequence.html.

XX
XX New Propionibacterium acnes polypeptides and polynucleotides encoding the
XX polypeptide, useful for diagnosing, preventing or treating acne vulgaris,
XX or for stimulating an immune response specific for a P. acnes protein.
XX
XX Claim 7; SEQ ID NO 30309; 1481pp; English.
XX
XX The invention relates to an isolated polynucleotide (ACF64435-ACF64733)
XX encoding a Propionibacterium acnes protein. The invention also relates to
XX polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to
XX immunogenic fragments of P. acnes polypeptides. The invention
XX additionally encompasses expression vectors and host cells comprising a
XX polynucleotide of the invention; antibodies against polypeptides of the
XX invention; fusion proteins comprising a polypeptide of the invention; a
XX method for stimulating an immune response specific for a P. acnes
XX polypeptide and an isolated T cell population comprising T cells prepared
XX via this method; a vaccine composition (comprising P. acnes polypeptides,
XX polynucleotides, antibodies, fusion proteins, T cell populations, or
XX antigen-presenting cells that express the polypeptide); a method and kit
XX for detecting or determining the presence or absence of P. acnes in a
XX patient; and a method for inhibiting the development of P. acnes in a
XX patient. The P. acnes polypeptides, polynucleotides, antibodies, fusion
XX proteins, T cell populations or antigen-presenting cells that express the
XX polypeptides are useful for diagnosing, preventing or treating acne
XX vulgaris, or for stimulating an immune response specific for a P. acnes
XX protein. The polynucleotides can also be used as probes or primers for
XX nucleic acid hybridisation. The vaccine composition is useful for the
XX stimulation of an immune response against P. acnes, or for treating acne,
XX and the kit is useful for performing a diagnostic assay. The present
XX sequence represents a specifically claimed P. acnes polypeptide which is
XX thought to contain an immunogenic region. Note: The sequence data for
XX this patent did not form part of the printed specification, but was
XX obtained in electronic format directly from WIPO at
XX ftp.wipo.int/pub/published_pct_sequences

XX PS Claim 14; SEQ ID NO 1309; 291pp; English.
XX CC The invention describes a new first nucleic acid molecule comprising a
XX CC polynucleotide sequence given in the specification. Also described are:
XX CC an animal injected with the nucleic acid molecule; a second nucleic acid
XX CC molecule comprising a second polynucleotide sequence that is at least
XX CC about 70, 80, 90 or 95% homologous to the first nucleic acid molecule or
XX CC that hybridises to the first polynucleotide sequence under high
XX CC stringency conditions; a vector comprising the nucleic acid molecule and
XX CC a promoter that drives the expression of the nucleic acid molecule; a
XX CC host cell transformed, transfected, transduced or infected with the
XX CC nucleic acid molecule; a nucleic acid composition comprising a carrier or
XX CC a buffer and one or more compositions comprising the nucleic acid
XX CC molecule, vector or host cell; a substantially purified polypeptide; an
XX CC animal injected with the polypeptide; a polypeptide composition
XX CC comprising the polypeptide molecule and a carrier or buffer; a cell
XX CC culture medium comprising the polypeptide or transfected cells
XX CC transfected with the polynucleotide; making a transformed, transfected,
XX CC transduced, or infected host cell; synthesising Nanodiscs simultaneously
XX CC and for synthesising a series of simultaneously-synthesised Nanodiscs
XX CC sequentially utilising a dynamic system; preparing a hydrophobic protein
XX CC for determination of crystal structure; immunising a non-human animal;
XX CC screening for modulators of hydrophobic protein activity; a diagnostic
XX CC kit; determining the presence of the nucleic acid molecule or its
XX CC complement; determining the presence of an antibody to the polypeptide in
XX CC a sample; an antibody specifically recognising, binding to or modulating
XX CC the biological activity of at least one polypeptide encoded by a nucleic
XX CC acid molecule or its biologically active fragment; an antibody
XX CC composition comprising the antibody and a carrier; a bacteriophage, where
XX CC the antibody is displayed on the bacteriophage; a bacterial cell
XX CC comprising the bacteriophage; a non-human animal injected with the
XX CC antibody composition; a host cell that secretes the antibody; making an
XX CC antibody; diagnosing a disease, disorder, syndrome, or condition
XX CC comprising cancer, or proliferative, inflammatory, immune, metabolic,
XX CC bone, CNS, genetic, bacterial and viral diseases, disorders, syndromes or
XX CC conditions in a patient; a modulator composition comprising a modulator
XX CC and a carrier; gene therapy; prophylactic or therapeutic treatment of a
XX CC subject; an isolated modified cell comprising at least one first
XX CC heterologous nucleic acid molecule, where the first heterologous nucleic
XX CC acid molecule comprises a first polynucleotide sequence that encodes a
XX CC first polypeptide; a non-human animal deficient in the polypeptide or
XX CC that over-expresses the polypeptide; isolated tissues derived from the
XX CC non-human animal; and one or more cells derived from the non-human
XX CC animal. The nucleic acid is useful in preparing a composition for
XX CC diagnosing or treating e.g., cancer, psoriasis or ulcerative colitis.
XX CC This is the amino acid sequence of a novel human polypeptide of the
XX CC invention.

DR
XX New recombinant DNA construct comprising a promoter positioned to provide
PT for expression of a polynucleotide encoding a polypeptide from a
PT microbial source, useful for producing plants with improved properties.
XX
PS Claim 1; SEQ ID NO 17745; 122pp; English.

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant having an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic

CC format from USPTO at seqdata.uspto.gov/sequence.html.

XX
PT New antisense nucleic acids, useful for identifying proteins or screening
PT for homologous nucleic acids required for cellular proliferation to
PT isolate candidate molecules for rational drug discovery programs.
XX
PS Claim 25; SEQ ID NO 51455; 1766pp; English.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
CC (1) a vector comprising a promoter operably linked to the nucleic acid
CC encoding a polypeptide whose expression is inhibited by the antisense
CC nucleic acid; (2) a host cell containing the vector; (3) an isolated
CC polypeptide or its fragment whose expression is inhibited by the
CC antisense nucleic acid; (4) an antibody capable of specifically binding
CC the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
CC proliferation or the activity of a gene in an operon required for
CC proliferation; (7) identifying a compound that influences the activity of
CC the gene product or that has an activity against a biological pathway
CC required for proliferation, or that inhibits cellular proliferation; (8)
CC identifying a gene required for cellular proliferation or the biological
CC pathway in which a proliferation-required gene or its gene product lies
CC or a gene on which the test compound that inhibits proliferation of an
CC organism acts; (9) manufacturing an antibiotic; (10) profiling a
CC compound's activity; (11) a culture comprising strains in which the gene
CC product is overexpressed or underexpressed; (12) determining the extent
CC to which each of the strains is present in a culture or collection of

CC strains; or (13) identifying the target of a compound that inhibits the
CC proliferation of an organism. The antisense nucleic acids are useful for
CC identifying proteins or screening for homologous nucleic acids required
CC for cellular proliferation to isolate candidate molecules for rational
CC drug discovery programs, or for screening homologous nucleic acids
CC required for proliferation in cells other than *S. aureus*, *S. typhimurium*,
CC *K. pneumoniae* or *P. aeruginosa*. The present sequence is encoded by one of
CC the target prokaryotic essential genes. Note: The sequence data for this
CC patent did not form part of the printed specification, but was obtained
CC in electronic format directly from WIPO at
CC ftp.wipo.int/pub/published_pct_sequences

PT New bacterial polypeptides designated as yael family polypeptides, useful
PT for identification of novel broad-spectrum antibiotics.
XX
PS Claim 1; Fig 1; 96pp; English.
XX

The invention provides isolated bacterial polypeptides belonging to a family designated the yael family. The yael family polypeptides are defined by one of the following: (i) a high-scoring segment pair (HSP) score of greater than or equal to 250 when compared with one of the specific yael family member sequences given in the specification using the known BLAST search algorithm (Altschul, S.F. et al, J. Mol. Biol. (1990) 215:403-10) with a BLOSUM62 scoring matrix (Proteins (1993) 17:49-61); or (ii) identified by profile based searches using known MAST technique to yield a p-value of less than 1×10^{-30} and position-dependent scoring matrices given in the specification for yael family members; or (iii) comprising at least two amino acid sequences from (a) or sequence of (b): (a) h-e-(tlyf)-g-h-(lf)-x-x-a; n-l-x-p-x-l-d-g; and (pl)-(lv)-g-g-(yf)-(cv); and (b) h-e-(tlvmfyw)-g-h-(lf)-x(2)-a-x(30,40)-(pl)-(lv)-g-g-(yf)-(cv). Where: letters designate amino acid one letter codes; letters in square brackets denote alternative single amino acids; x is any amino acid; and numbers in brackets indicate the number of residues at that position. The polypeptides are useful to screen for agents with antibiotic activity. They are especially useful in the development of new broad-spectrum antibiotics, since they are conserved across, and believed to be essential for the viability of, taxonomically diverse bacteria, including both gram negative and gram positive bacteria. Antagonists identified by such screens may be administered therapeutically to treat bacterial infections and used to manufacture medicaments for such treatment. The polynucleotides encoding the polypeptides are useful in antibiotic screening as above, as probes for other members of the gene family or in antisense therapy to block or reduce polypeptide expression to treat bacterial mediated disorders. Sequences AAY40492-501 represent yael family polypeptides of different bacterial species

PT Novel shrunken seed gene useful for producing transgenic plants having
PT altered production of food storage reserve material, intracellular
PT transport of storage protein and formation of protein or oil bodies.
XX
PS Claim 2; Page 58; 64pp; English.
XX

The present sequence is that of Arabidopsis thaliana SSE1 (shrunken seed) protein, as deduced from isolated cDNA (see AAA88782). SSE1 protein, when expressed in a cell of a plant, modifies or alters the production of a food storage reserve material (e.g. protein, lipid or carbohydrate storage reserve), facilitates the intracellular transport of a storage protein, or facilitates the formation of protein or oil bodies. The invention provides a transgenic plant for plant cell, plant tissue, plant organ or plant component) which includes a recombinant SSE1 transgene that modifies the production of food storage reserves, thereby increasing nutritional value. An antisense construct is useful for modifying desiccation tolerance

XX New isolated SSE1 polynucleotide for producing plants capable of
PT partitioning photosynthate to produce seed with improved functional
PT properties for use in specific food and non-food industrial applications.
XX Disclosure; SEQ ID NO 15; 38pp; English.
XX This invention relates to novel isolated nucleic acids which encode SSE1
CC (shrunk seed 1) homologues. Seeds of flowering plants contain proteins,
CC starches and oils in a balance suitable to support seedling growth of the
CC next generation. Users of seeds for food, feed or industrial purposes
CC often desire modifications in quality or quantity of these components.
CC SSE1 was cloned from Arabidopsis thaliana and is thought to be involved
CC in the pathway leading to seed storage protein and lipid deposition. If
CC this pathway is inactivated, seed starch deposition proceeds by default.
CC Altered expression of SSE1 can increase the starch deposition in the
CC endosperm, or increase the oil deposition in the embryo, increase the
CC protein content in the seed, or increase the oil and protein content in
CC the seed. The sequences of the invention may also be used to modulate
CC storage organ formation in the seed of a plant. Hence the invention may
CC be used to improve the food, feed and/or industrial value of grain. The
CC present sequence is the amino acid sequence of the Arabidopsis thaliana
CC SSE1 protein, which was used to identify the SSE1 homologues of the

CC invention.

XX New isolated polynucleotide and encoded polypeptides, useful in
PT diagnostics, forensics, gene mapping, identification of mutations
PT responsible for genetic disorders or other traits and to assess
PT biodiversity.
XX Claim 20; SEQ ID NO 60281; 103pp; English.
XX The invention relates to isolated polynucleotide (I) and polypeptide (II)
CC sequences. (I) is useful as hybridisation probes, polymerase chain
CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
CC and in recombinant production of (II). The polynucleotides are also used
CC in diagnostics as expressed sequence tags for identifying expressed
CC genes. (I) is useful in gene therapy techniques to restore normal
CC activity of (II) or to treat disease states involving (II). (II) is
CC useful for generating antibodies against it, detecting or quantitating a
CC polypeptide in tissue, as molecular weight markers and as a food
CC supplement. (II) and its binding partners are useful in medical imaging
CC of sites expressing (II). (I) and (II) are useful for treating disorders
CC involving aberrant protein expression or biological activity. The
CC polypeptide and polynucleotide sequences have applications in
CC diagnostics, forensics, gene mapping, identification of mutations
CC responsible for genetic disorders or other traits to assess biodiversity
CC and to produce other types of data and products dependent on DNA and
CC amino acid sequences. ABG0010-ABG0377 represent novel human diagnostic
CC amino acid sequences of the invention. Note: The sequence data for this
CC patent did not appear in the printed specification, but was obtained in
CC electronic format directly from WIPO at
CC ftp.wipo.int/pub/published_pct_sequences

XX PT for homologous nucleic acids required for cellular proliferation to
XX PT isolate candidate molecules for rational drug discovery programs.
XX PS
XX Claim 25; SEQ ID NO 77595; 1766pp; English.
XX CC
XX The invention relates to an isolated nucleic acid comprising any one of
XX CC the 6213 antisense sequences given in the specification where expression
XX CC of the nucleic acid inhibits proliferation of a cell. Also included are:
XX CC (1) a vector comprising a promoter operably linked to the nucleic acid
XX CC encoding a polypeptide whose expression is inhibited by the antisense
XX CC nucleic acid; (2) a host cell containing the vector; (3) an isolated
XX CC polypeptide or its fragment whose expression is inhibited by the
XX CC antisense nucleic acid; (4) an antibody capable of specifically binding
XX CC the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
XX CC proliferation or the activity of a gene in an operon required for
XX CC proliferation; (7) identifying a compound that influences the activity of
XX CC the gene product or that has an activity against a biological pathway
XX CC required for proliferation, or that inhibits cellular proliferation; (8)
XX CC identifying a gene required for cellular proliferation or the biological
XX CC pathway in which a proliferation-required gene or its gene product lies
XX CC or a gene on which the test compound that inhibits proliferation of an
XX CC organism acts; (9) manufacturing an antibiotic; (10) profiling a
XX CC compound's activity; (11) a culture comprising strains in which the gene
XX CC product is overexpressed or underexpressed; (12) determining the extent
XX CC to which each of the strains is present in a culture or collection of
XX CC strains; or (13) identifying the target of a compound that inhibits the
XX CC proliferation of an organism. The antisense nucleic acids are useful for
XX CC identifying proteins or screening for homologous nucleic acids required
XX CC for cellular proliferation to isolate candidate molecules for rational
XX CC drug discovery programs, or for screening homologous nucleic acids
XX CC required for proliferation in cells other than *S. aureus*, *S. typhimurium*,

CC K. pneumoniae or *P. aeruginosa*. The present sequence is encoded by one of
CC the target prokaryotic essential genes. Note: The sequence data for this
CC patent did not form part of the printed specification, but was obtained
CC in electronic format directly from WIPO at
CC ftp.wipo.int/pub/published_pct_sequences

XX PT
XX New recombinant DNA construct comprising a promoter positioned to provide
XX PT for expression of a polynucleotide encoding a polypeptide from a
XX PT microbial source, useful for producing plants with improved properties.
XX PS Claim 1; SEQ ID NO 17809; 122pp; English.
XX CC
XX The invention relates to a recombinant DNA construct comprising a
XX CC promoter functional in a plant cell, where the promoter is positioned to
XX CC provide for expression of a polynucleotide encoding a polypeptide from a
XX CC microbial source. The invention also relates to a transformed plant
XX CC comprising the recombinant DNA construct and a method of producing a
XX CC transformed plant having an improved property. The plant is a crop plant
XX CC such as maize or soybean. The method of producing a transformed plant
XX CC having an improved property comprises transforming a plant with the
XX CC recombinant DNA construct and growing the transformed plant, where the
XX CC polynucleotide or polypeptide is useful for improving plant properties.
XX CC The recombinant DNA construct is useful for producing plants with
XX CC improved plant properties, e.g. improved cold, heat or drought tolerance,

CC tolerance to herbicides, extreme osmotic conditions, pathogens or pests,
CC increased resistance to plant disease, better growth rate by modification
CC of the cell cycle pathway with plant growth regulators, increased rate of
CC homologous recombination, modified seed oil or protein yield and/or
CC content, improved yield by modification of carbohydrate, nitrogen or
CC phosphorus use and/or uptake, by modification of photosynthesis or by
CC providing improved plant growth and development under at least one stress
CC condition, improved lignin production or improved galactomannan
CC production. This sequence represents a bacterial polypeptide used in the
CC scope of the invention. Note: The sequence data for this patent did not
CC form part of the printed specification but was obtained in electronic
CC format from USPTO at seqdata.uspto.gov/sequence.html.

New polynucleotides and secreted proteins, useful for treating myeloid or lymphoid cell disorders, in bone cartilage, tendon, ligament and nerve tissue growth or regeneration, in wound healing, and in tissue repair and replacement.

Claim 20; SEQ ID NO 475; 156pp; English.

The invention relates to an isolated polynucleotide encoding a polypeptide with biological activity. The polynucleotides and polypeptides are useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders and other traits, to assess biodiversity, as nutritional sources or supplements. The polynucleotides may also be used as molecular weight markers, chromosome markers or map related gene positions, or as an antigen to raise anti-DNA antibodies or elicit immune response. The polypeptides are useful for raising antibodies, as markers for tissues in which the corresponding polypeptide is expressed, for re-engineering damaged or diseased tissues, for treating myeloid or lymphoid cell disorders, in bone cartilage, tendon, ligament and/or nerve tissue growth or regeneration, in wound healing, in tissue repair and replacement, in healing of burns, incisions and ulcers, and in treating cancer. The present sequence represents the amino acid sequence of a novel human protein.

Novel polypeptides and nucleic acids obtained from cDNA libraries prepared from various human tissues, for diagnosis, treatment of cancer, neurological, inflammatory disorders and for use in arrays for detection.

Claim 10; SEQ ID NO 309; 153pp; English.

Sequences AAU27676-AAU28019 represent full-length polypeptides and contig polypeptides of the invention. The proteins and their associated DNA sequences are useful for the treatment, diagnosis and prevention of various types of disorder in a mammalian subject such as a human, dog, monkey, mouse, hamster or rat. The disorders include cancers such as leukaemia, lymphoma and neuroblastoma, autoimmune disorders such as multiple sclerosis, connective tissue disease, rheumatoid arthritis, diabetes mellitus, allergic rhinitis, asthma and eczema, nervous system disorders such as Parkinson's disease, Alzheimer's disease, Huntington's chorea, anyotrophic lateral sclerosis, spinal muscular atrophy and Wernicke disease, inflammatory disorders such as nephritis, Crohn's disease, ischaemia-reperfusion injury, shock, sepsis and inflammatory bowel disease. The sequences exhibit activity relating to angiogenesis, cell proliferation, cell differentiation, stem cell growth factor, activin or inhibin. Therefore, they can be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, accidental damage or genetic disorders. The sequences may also be used for regeneration of bone, cartilage, tendons and ligaments and in tissue repair and burn healing. Note: Some sequences for this patent did not form part of the printed specification, but were obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

PT New compositions having outer-membrane vesicles and proteins from
PT *Neisseria meningitidis*, useful in the field of meningococcal
PT biochemistry, in particular for preventing and/or treating meningococcal
PT infections.
XX
PS Claim 9; SEQ ID NO 86; 79pp; English.
XX
XX The invention relates to a novel composition comprising outer-membrane
CC vesicles (OMV) prepared from a first strain of *Neisseria meningitidis* and
CC 1 or more proteins which are present in OMVs prepared from a second

CC strain of *N. meningitidis*, but which are not present in OMVs prepared
 CC from the first strain. The composition of the invention demonstrates
 CC antibacterial and anti-inflammatory activities and may be useful in the
 CC field of meningococcal biochemistry, in particular the trafficking and
 CC localisation of meningococcal proteins, as well as in the prevention or
 CC treatment of meningococcal infections, possibly via the production of a
 CC vaccine or gene therapy. The current sequence is that of a *Neisseria*
 CC meningitidis MC58 outer-membrane vesicle (OMV)-related membrane protein
 CC of the invention.

XX New recombinant DNA construct comprising a promoter positioned to provide
PT for expression of a polynucleotide encoding a polypeptide from a
PT microbial source, useful for producing plants with improved properties.
XX
XX Claim 1; SEQ ID NO 19333; 122pp; English.
XX
XX The invention relates to a recombinant DNA construct comprising a
CC promoter functional in a plant cell, where the promoter is positioned to
CC provide for expression of a polynucleotide encoding a polypeptide from a
CC microbial source. The invention also relates to a transformed plant
CC comprising the recombinant DNA construct and a method of producing a
CC transformed plant having an improved property. The plant is a crop plant
CC such as maize or soybean. The method of producing a transformed plant
CC having an improved property comprises transforming a plant with the
CC recombinant DNA construct and growing the transformed plant, where the
CC polynucleotide or polypeptide is useful for improving plant properties.
CC The recombinant DNA construct is useful for producing plants with
CC improved plant properties, e.g. improved cold, heat or drought tolerance,
CC tolerance to herbicides, extreme osmotic conditions, pathogens or pests,
CC increased resistance to plant disease, better growth rate by modification
CC of the cell cycle pathway with plant growth regulators, increased rate of
CC homologous recombination, modified seed oil or protein yield and/or
CC content, improved yield by modification of carbohydrate, nitrogen or
CC phosphorus use and/or uptake, by modification of photosynthesis or by
CC providing improved plant growth and development under at least one stress
CC condition. Improved lignin production or improved galactomannan
CC production. This sequence represents a bacterial polypeptide used in the
CC scope of the invention. Note: The sequence data for this patent did not
CC form part of the printed specification but was obtained in electronic

XX New recombinant DNA construct, useful for improving plant tolerance to
XX cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or
XX pests, for conferring increased resistance to plant disease, or for
XX improving yield.

XX Claim 1; SEQ ID NO 58833; 15pp; English.

XX The invention describes a recombinant DNA construct comprising a
XX polynucleotide consisting of a sequence encoding an amino acid sequence
XX available in electronic form from the US patent office at
XX ftp.seqdata.uspto.gov/sequence.html?DocID:2004034888. The polynucleotide
XX of the invention are also useful in physical arrays of molecules and as
XX plant breeding markers. The recombinant DNA construct is useful for
XX improving plant tolerance to cold, heat, drought, herbicides, extreme
XX osmotic conditions, pathogens or pests, for manipulating growth rate in
XX plant cells by modification of the cell cycle pathway, for conferring
XX increased resistance to plant disease, for producing galactomannan,
XX lignin or plant growth regulators, for increasing the rate of homologous
XX recombination in plants, for improving yield by modification of
XX photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake

CC or by providing improved plant growth and development under at least one
CC stress condition or for modifying seed oil or protein yield and/or
CC content. This is the amino acid sequence of a plant full length insert
CC polypeptide that can be used in the recombinant DNA construct of the
CC invention.

XX
XX Production of indolo-carbazole antitumor agents, especially rebeccamycin
or derivatives, by culturing host cells transformed with vector
containing DNA from Saccharothrix aerocolonigenes.

PS Claim 10; SEQ ID NO 18; 76pp; Spanish.

XX
XX The invention relates to a method for the production of indolocarbazoles
in Streptomyces (especially Streptomyces albus) using rebeccamycin
biosynthetic genes isolated from Saccharothrix aerocolonigenes ATCC39243.
CC The invention also relates to the Saccharothrix aerocolonigenes ATCC39243
rebeccamycin biosynthetic gene cluster (ADJ53165) and sequences at least
80% homologous to it; nucleic acids encoding one or more rebeccamycin
biosynthetic proteins; the 18 rebeccamycin biosynthetic proteins
(ADJ53166-ADJ53183) encoded by the gene cluster; and vectors and host
cells comprising nucleic acid sequences of the invention.
CC Indolocarbazoles (especially rebeccamycin) and their derivatives and
precursors are useful as antitumor agents. Rebeccamycin also shows
antibacterial activity against Gram positive bacteria such as
Staphylococcus aureus, Micrococcus luteus and Streptococcus faecalis. The
recombinant Streptomyces albus of the invention produce increased yields
of indolocarbazoles compared with Saccharothrix aerocolonigenes
ATCC39243, and may permit the production of novel indolocarbazole
compounds (e.g., halogenated derivatives). The present sequence

CC represents a specifically claimed rebeccamycin biosynthetic protein from
CC Saccharothrix aerocolonigenes ATCC39243.

XX New substantially purified Myxococcus xanthus nucleic acid molecule
encoding a nitrite reductase, useful for determining gene expression,
identifying mutations in a gene of interest, and for constructing
mutations in a gene of interest.

PS Example 2; SEQ ID NO 11909; 25pp; English.

XX
XX The invention relates to a substantially purified nucleic acid molecule
encoding a nitrite reductase of SEQ ID NO. 11926. Further disclosed is a
recombinant DNA construct for expression of a nitrite reductase gene in a
plant cell, and a plant cell comprising the recombinant DNA construct.
CC The nucleic acid is useful for determining gene expression, identifying
mutations in a gene of interest, and for constructing mutations in a gene
of interest. Sequences given in records for SEQ IDs 9692-16825 represent
a group of 7134 Myxococcus xanthus proteins and peptides. Note: The

XX PT Genomic sequence of Photorhabdus luminescens and encoded polypeptides,
 PT useful e.g. as therapeutic antimicrobials and agricultural pesticides.

XX PS Claim 2; SEQ ID NO 715; 1205pp; French.

XX The invention relates to the isolation of genes and their encoded
 CC proteins from Photorhabdus luminescens. The isolated sequences are
 CC sources of probes and primers for detecting the genome of P. luminescens
 CC and related species; to study polymorphisms; for gene analysis and for
 CC detection/amplification of the genes. Antibodies (Ab) raised against the
 CC polypeptides encoded by the genes are used for detection/identification
 CC of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that
 CC carry a gene-containing vector are used to select compounds that
 CC modulate, regulate, induce or inhibit expression of the genes in plants,
 CC animals or microorganisms other than P. luminescens and are able to alter
 CC response or sensitivity to toxins and antibiotics produced by P.
 CC luminescens. Cells transformed to express the genes are useful for
 CC recombinant production of the proteins, particularly toxins and
 CC antibacterials useful as insecticides, bactericides and fungicides. The
 CC genes, proteins, vectors containing the genes and Ab are also useful
 CC therapeutically (to treat microbial infection by bacteria or fungi that
 CC are sensitive to P. luminescens-encoded toxins or antibiotics) and as
 CC biopesticides. Other uses of the genes and the proteins are as virulence
 CC factors and for identifying targets of human diseases for which P.
 CC luminescens is a model (particularly plague and whooping cough). This
 CC sequence represents one of the isolated P. luminescens proteins

PT prepared from various human tissues, for diagnosis, treatment of cancer,
PT neurological, inflammatory disorders and for use in arrays for detection.
XX
XX Claim 10; Page 142-143; 153pp; English.
PS
XX Sequences AAU27676-AAU28019 represent full-length polypeptides and contig
CC polypeptides of the invention. The proteins and their associated DNA
CC sequences are useful for the treatment, diagnosis and prevention of
CC various types of disorder in a mammalian subject such as a human, dog,
CC monkey, mouse, hamster or rat. The disorders include cancers such as
CC leukaemia, lymphoma and neuroblastoma, autoimmune disorders such as
CC multiple sclerosis, connective tissue disease, rheumatoid arthritis,
CC diabetes mellitus, allergic rhinitis, asthma and eczema, nervous system
CC disorders such as Parkinson's disease, Alzheimer's disease, Huntington's
CC chorea, amyotrophic lateral sclerosis, spinal muscular atrophy and
CC Wernicke disease, inflammatory disorders such as nephritis, Crohn's
CC disease, ischaemia-reperfusion injury, shock, sepsis and inflammatory
CC bowel disease. The sequences exhibit activity relating to angiogenesis,
CC cell proliferation, cell differentiation, stem cell growth factor,
CC activin or inhibin. Therefore, they can be used to manipulate stem cells

CC in culture to give rise to neuroepithelial cells that can be used to
CC augment or replace cells damaged by illness, accidental damage or genetic
CC disorders. The sequences may also be used for regeneration of bone,
CC cartilage, tendons and ligaments and in tissue repair and burn healing.

XX PT New DNA encoding glutamate-malate transporter, useful for producing
PT transgenic plants with altered nitrogen metabolism, particularly
PT increased protein content.

XX PS Disclosure; Page 33-35; 41pp; German.

XX CC This invention describes novel DNA sequences (I) containing the coding
CC region of a glutamate-malate transporter (II). The products of the
CC invention have herbicidal activity. (II) exports glutamate, which is the
CC main amino donor for a wide variety of transamination reactions, from
CC chloroplasts and is a key regulator in intracellular partitioning of
CC amino group donors and acceptors. (I) and its derivatives are used: (i)
CC to express (II) in prokaryotic or eukaryotic cells; (ii) for isolation of
CC DNA encoding (II); (iii) for combination with target sequences to provide
CC expression of (II) in other cell compartments or membrane systems; (iv)
CC to identify agents that inhibit transport of dicarboxylic acids across
CC the inner plastid membrane (potential total herbicides); (v) to isolate
CC corresponding genomic clones; (vi) to produce sequences that encode
CC dicarboxylic acid translocators with altered substrate specificity or to
CC impart resistance to inhibitors of (iv), for development of selective
CC herbicides; and (vii) to identify insertional mutants, for homologous
CC recombination and for expression of non-translatable RNA (by antisense,
CC co-suppression or ribozyme effects) to suppress one or more endogenous
CC plastid (II) in cells. The promoter region of (I) may be used to provide
CC tissue-specific expression of genes. Expression/suppression of (II)
CC modifies formation and transport of carbon skeletons for nitrogen
CC fixation, and thus transport of assimilable nitrogen, e.g. it may produce
CC plants with reduced carbohydrate content but increased content of organic
CC nitrogen (proteins, amino acids, alkaloids), particularly food or fodder
CC plants with increased protein content. This sequence represents the
CC Flaveria bidentis glutamate/malate translocator protein which is
CC described in the invention

XX The invention relates to a cellulase (ADH12819) from the abalone Haliotis
CC discus hannai. The cellulase is present in high levels in the liver
CC pancreas of the abalone, particularly the anterior portion. The mature
CC cellulase (EC 3.2.1.4) has an N-terminal sequence given in ADH12801, and
CC has a molecular weight of 66 kD, a pH optimum of 5.5-8.0, an optimum
CC temperature of 35-40 degrees Celsius, and is stable at 40 degrees Celsius
CC or below. The invention also encompasses a method for the preparation of
CC the cellulase from abalone internal organs, and further discloses a cDNA
CC sequence (ADH12800) encoding the cellulase. The abalone cellulase is
CC useful in the de-inking and decolouring processes in paper manufacturing,
CC in detergent compositions, and in the manufacture of foods or animal
CC fodder. It is also useful in the degradation of biomass for energy
CC production and for the production of cellico-oligosaccharides such as
CC cellobiose and cellulose. The cellulase of the invention is extracted
CC from parts of abalone which are inedible, thousands of tonnes of which
CC are discarded during processing of the shellfish as a foodstuff. The
CC method of the invention permits helps to reduce the environmental impact
CC of this waste, and permits the inexpensive and rapid production of large
CC quantities of cellulase. The present sequence represents the abalone
CC cellulase of the invention. Note: The present sequence is listed as SEQ
CC ID NO:1 along with the cDNA encoding it in the sequence listing. However,
CC claim 1 refers to the protein sequence only of SEQ ID NO:1.

XX
XX New recombinant DNA construct comprising a promoter positioned to provide
PT for expression of a polynucleotide encoding a polypeptide from a
PT microbial source, useful for producing plants with improved properties.
XX
XX Claim 1; SEQ ID NO 2601; 122pp; English.
PS
XX The invention relates to a recombinant DNA construct comprising a
CC promoter functional in a plant cell, where the promoter is positioned to
CC provide for expression of a polynucleotide encoding a polypeptide from a
CC microbial source. The invention also relates to a transformed plant
CC comprising the recombinant DNA construct and a method of producing a
CC transformed plant having an improved property. The plant is a crop plant
CC such as maize or soybean. The method of producing a transformed plant
CC having an improved property comprises transforming a plant with the
CC recombinant DNA construct and growing the transformed plant, where the
CC polynucleotide or polypeptide is useful for improving plant properties.
CC The recombinant DNA construct is useful for producing plants with
CC improved plant properties, e.g. improved cold, heat or drought tolerance,
CC tolerance to herbicides, extreme osmotic conditions, pathogens or pests,
CC increased resistance to plant disease, better growth rate by modification
CC of the cell cycle pathway with plant growth regulators, increased rate of
CC homologous recombination, modified seed oil or protein yield and/or
CC content, improved yield by modification of carbohydrate, nitrogen or
CC phosphorus use and/or uptake, by modification of photosynthesis or by
CC providing improved plant growth and development under at least one stress
CC condition, improved lignin production or improved galactomannan
CC production. This sequence represents a bacterial polypeptide used in the
CC scope of the invention. Note: The sequence data for this patent did not
CC form part of the printed specification but was obtained in electronic
CC format from USPTO at seqdata.uspto.gov/sequence.html.

XX New isolated polynucleotide, useful in research, diagnostic or
 PT therapeutic methods, e.g. preventing or treating disorders involving
 PT aberrant protein expression or biological activity.

XX Claim 20; SEQ ID NO 481; 394pp; English.

XX The present invention relates to novel human coding sequences (ABQ99268-
 CC ABQ99608) and proteins (ABP64682-ABP65022). The sequences are useful in
 CC therapeutic, diagnostic and research methods. The polynucleotides may be
 CC used in the field of molecular biology as hybridisation probes, primers
 CC for PCR, for chromosome and gene mapping, for the recombinant production

CC of protein, or in generation of anti-sense DNA or RNA. The
 CC polynucleotides are useful in diagnostics as expressed sequence tags
 CC (ESTs) for identifying expressed genes or for physical mapping of the
 CC human genome. The proteins may be used as molecular weight markers or as
 CC nutritional sources or supplements. The proteins may be used to maintain
 CC and expand cell population in a totipotential or pluripotential state
 CC useful for re-engineering damaged or diseased tissues, transplantation,
 CC manufacture of bio-pharmaceuticals or the development of bio-sensors. The
 CC polynucleotides and proteins are useful for preventing, treating or
 CC ameliorating disorders involving aberrant protein expression or
 CC biological activity, e.g. haematopoietic disorders, central/peripheral
 CC nervous system diseases, mechanical and traumatic disorders, non-healing
 CC wounds, immune deficiencies and disorders, infectious diseases caused by
 CC viral, bacterial or fungal infection, autoimmune disorders, allergic
 CC reactions and conditions, coagulation disorders, or cancer. The
 CC polynucleotide sequences of the invention were assembled from ESTs
 CC isolated mainly by sequencing by hybridisation, and in some cases,
 CC sequences obtained from one or more public databases. Note: The sequence
 CC data for this patent did not form part of the printed specification, but
 CC was obtained in electronic format directly from WIPO at
 CC ftp.wipo.int/pub/published_pct_sequences

XX
XX Use of a polypeptide comprising one or more consensus regions of proteins
PT of LIV-1 family for treating disorders of zinc homeostasis such as breast
PT cancer, neurodegenerative disorders, and for modifying apoptosis.
XX
XX Claim 1; Fig 1; 67pp; English.
XX
XX The invention describes the a polypeptide comprising one or more
CC consensus regions of proteins of LIV-1 family or its functional
CC homologue. The polypeptide is useful in the preparation of a medicament
CC for the treating a disease e.g. those involving disorders of zinc
CC homeostasis, in gene therapy and for modifying apoptosis in vitro or in
CC vivo on contact with cells. Diseases involving defects in zinc
CC homeostasis include cancer, neurodegenerative disorders and apoptotic
CC disorders. Recombinant proteins of the LIV-1 family (an oestrogen-

CC regulated gene) are useful for diagnosing a zinc homeostasis-related
CC condition in a subject which involves contacting a sample from the
CC subject with the recombinant protein and measuring the binding of
CC antibody to the sample. The antibody is also useful for treating a zinc
CC homeostasis-related condition. This sequence is a member of the LIV-1
CC family (a gene regulated by oestrogen levels) and is useful for creating
CC recombinant proteins for diagnosing zinc-homeostasis related conditions,
XX described in the method of the invention

XX
XX Assessing whether a patient is afflicted with ovarian cancer, useful in
PT assessing the stage or progression of the disease, comprises comparing
PT the expression level of a cancer marker in a sample from a patient and
PT from a non cancer patient.
XX
XX Disclosure; Page 222-223; 481pp; English.
XX
XX The present invention relates to a new method for assessing whether a
CC patient is afflicted with ovarian cancer. The method involves comparing
CC the expression level of a marker in a patient sample and the normal level

of expression of the marker in a control non-ovarian cancer sample, where the marker is selected from 363 cancer markers described in the specification. The method of the invention is useful in diagnosing or characterising cancer, in detecting the presence of cancer as early as possible, and the recurrence of ovarian cancer. The method may also be of particular use with patients having an enhanced risk of developing ovarian cancer (e.g. patients having a familial history of ovarian cancer). The cancer markers may be used in the management and treatment of e.g. brain and central nervous system disorders (e.g. bacterial and viral meningitis, Alzheimer's disease or Parkinson's disease), brain disorders (e.g. cerebral oedema, hydrocephalus or brain herniations), inflammations (e.g. bacterial or viral meningitis or encephalitis), testicular disorders (e.g. nontuberculous granulomatous orchitis), connective tissue disorders, or heart disorders (e.g. ischaemic heart disease or atherosclerosis). The compositions and methods may also be used in assessing the histological type of neoplasm associated with ovarian cancer, monitoring the progression of ovarian cancer, determining whether ovarian cancer has metastasized or is likely to metastasize, selecting a composition for inhibiting ovarian cancer, assessing the ovarian carcinogenic potential of a compound, or inhibiting ovarian cancer or at risk of developing ovarian cancer. The present amino acid sequence represents one of the ovarian cancer markers described in the invention

New NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders e.g. diabetes, cancer, Alzheimer's disease, dyslipidemias, obesity, immune or hematopoietic disorders, and asthma.

Claim 1; Page 188; 619pp; English.

```

XX
CC The present invention relates to new isolated proteins (NOVX) and their
CC coding sequences (ABV99327-ABV99595 and ABP70049-ABP70149), where X is
CC any number from 1 to 48. The NOVX proteins and coding sequences are
CC useful in the manufacture of a medicament for treating a syndrome
CC associated with a human disease, preferably a NOVX-associated disorder.
CC The NOVX coding sequences and proteins are useful for treating,
CC preventing or diagnosing diseases such as metabolic disorders, diabetes,
CC obesity, infectious disease, anorexia, cancer-associated cachexia,
CC cancer, neurodegenerative diseases, Alzheimer's disease, Parkinson's
CC disease, immune disorders, haematopoietic disorders, cardiovascular
CC disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic
CC disturbances associated with obesity, metabolic syndrome X or wasting
CC disorders associated with chronic diseases or various cancers. The NOVX
CC coding sequences and proteins may also be used as targets for the
CC identification of small molecules that modulate or inhibit e.g.
CC neurogenesis, cell differentiation, cell proliferation, haematopoiesis,
CC wound healing and angiogenesis, in gene therapy, in generation of
CC antibodies that bind immunospecifically to NOVX substances for use in
CC therapeutic or diagnostic methods

XX bronchial cancer comprising 489 defined sequences given in the
XX specification. The invention may be useful for the production of
XX

```

CC	compounds with a cytostatic activity through the inhibition of expression
CC	or activity of tumour-associated proteins. The novel DNA sequences and
CC	the proteins/peptides encoded by them are used for detecting bronchial
CC	cancer or determining the risk of developing it and to screen for
CC	specific binding partners of the DNA or protein sequences, where the
CC	binding partners are potentially useful as agents for treating or
CC	diagnosing bronchial cancer. The DNA or protein sequences can also be
CC	used for prognosis, detection of metastases and for secondary treatment
CC	(of tumours that have been stabilised or are no longer detectable).
CC	Detecting abnormal expression of the DNA sequences provides early
CC	diagnosis of bronchial cancers. The present sequence is that of a protein
CC	encoded by a novel bronchial cancer-associated human gene sequence of the
CC	invention.

XX	
CC	The present sequence is human protein with hydrophobic domain, HP10755.
CC	The polynucleotide and polypeptide of the invention may be used in the

CC prevention, diagnosis and treatment of diseases associated with
 CC inappropriate polypeptide expression. The polynucleotides may be used to
 CC produce the polypeptide, by inserting the nucleic acids into a host cell
 CC and culturing the cell to express the protein. The polynucleotides and
 CC its complementary sequences may also be used as DNA probes in diagnostic
 CC assays and also used in gene therapy. The polypeptides may also be used
 CC as antigens in the production of antibodies and in assays to identify
 CC modulators of polypeptide expression and activity. The polypeptides and
 CC nucleic acids may be used as nutritional supplements, to modulate
 CC cytokine and cell proliferation activity, to modulate immune stimulation
 CC or suppression (e.g. for the treatment of microbial infections and
 CC autoimmune disorders such as multiple sclerosis, rheumatoid arthritis and
 CC insulin-dependent diabetes), to modulate haematopoiesis, to modulate
 CC tissue growth activity (e.g. for the treatment of Parkinson's disease,
 CC Huntington's disease and Alzheimer's disease), to modulate activin and
 CC inhibin activity (e.g. for controlling fertility), to modulate
 CC chemotactic and chemokinetic activity, to modulate haemostatic and
 CC thrombolytic activity, to modulate receptor ligand activity, to modulate
 CC inflammation and to inhibit tumour growth

XX Isolated polypeptide with a human membrane associated protein sequence is
 XX useful for the diagnosis, prevention and treatment of cell proliferative,
 XX autoimmune/inflammatory, neurological and gastrointestinal disorders.

PS Claim 1; Page 128-130; 173pp; English.

XX

CC AAF81741 to AAF81777 encode the human membrane associated proteins
 CC (MEMAP) given in AAB74695 to AAB74731. MEMAPs have cytostatic,
 CC antiinflammatory, anticonvulsant, immunosuppressive, antidiarrheic and
 CC antiarteriosclerotic activities, which can be used in gene therapy.
 CC MEMAPs and agonist of MEMAPs can be used to treat a disease or condition
 CC associated with decreased expression of functional MEMAP and antagonists
 CC of MEMAP are used to treat a disease or condition associated with
 CC overexpression of functional MEMAP. These disorders include cell
 CC proliferative, autoimmune/inflammatory, neurological and gastrointestinal
 CC disorders. The MEMAP polynucleotides and proteins are also used for the
 CC diagnosis of these disorders. Specific examples of these disorders
 CC include cancer, inflammation, atherosclerosis, epilepsy and diarrhoea.
 CC MEMAP proteins can be used to screen for compounds which specifically
 CC bind MEMAP including antibodies, oligonucleotides, proteins and small
 CC molecules. MEMAP polynucleotides can be used to prepare transgenic
 CC animals which can be studied to provide information concerning human
 CC disease. Anti-MEMAP antibodies are useful in immunoassays for the
 CC detection of MEMAP protein and can be used as antagonists to treat or
 CC prevent a disorder associated with MEMAP. Polynucleotides encoding MEMAP
 CC can be delivered to target cells with genetic abnormalities with respect
 CC to the expression of MEMAP to treat or prevent a disorder associated with
 CC MEMAP

XX Soppet DR, Komatsoulis G, Shi Y, Oleen HS, Ruben SM;
PI WPI; 2001-316492/33.
DR N-PSDB; AAD05497.
XX
XX Isolated nucleic acid molecule encoding a human secreted protein is used
PT in preventing, treating or ameliorating a medical condition.
XX
XX Claim 11; Page 467-469; 540pp; English.
XX
XX RAD05492-AAD05564 represent cDNAs corresponding to 22 human secreted
CC protein genes, and AAE01672-AAE01743 represent the proteins they encode.
CC AAE01744-AAE01763 represent human secreted protein fragments or variants.
CC The secreted proteins and their genes are useful for preventing, treating
CC or ameliorating medical conditions, e.g., by protein or gene therapy.
CC Pathological conditions can be diagnosed by determining the amount of the
CC new protein in a sample or by determining the presence of mutations in
CC the new genes. Specific uses are described for each of the 22 genes,
CC based on the tissues in which they are most highly expressed, and include
CC developing products for the diagnosis or treatment of proliferative
CC disorders, cancer, tumours, foetal and developmental abnormalities,
CC haematopoietic disorders, diseases of the immune system, AIDS, autoimmune
CC diseases (e.g., rheumatoid arthritis), inflammation, allergies,
CC neurological disorders (e.g., Alzheimer's disease, Parkinson's disease),
CC cognitive disorders, schizophrenia, asthma, skin disorders (e.g.,
CC psoriasis), sepsis, diabetes, atherosclerosis, cardiovascular disorders,
CC angiogenic disorders, kidney disorders, gastrointestinal disorders,
CC pregnancy-related disorders, endocrine disorders, and infections. The
CC proteins can also be used to aid wound healing and epithelial cell
CC proliferation, to prevent skin aging due to sunburn, to maintain organs
CC before transplantation, for supporting cell culture of primary tissues,
CC to regenerate tissues, to identify their cognate ligands or binding
CC partners, and in chemotaxis, and can be used as a food additive or
CC preservative to modify storage properties. Antibodies specific for a
CC protein of the invention can be used in alleviating symptoms associated
CC with the disorders mentioned above, and in diagnostic immunoassays e.g.,
CC radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The
CC present sequence represents a human secreted protein of the invention

XX
XX Use of a polypeptide comprising one or more consensus regions of proteins
PT of LIV-1 family for treating disorders of zinc homeostasis such as breast
PT cancer, neurodegenerative disorders, and for modifying apoptosis.
XX
XX Claim 1; Fig 1; 67pp; English.
XX
XX The invention describes the a polypeptide comprising one or more
CC consensus regions of proteins of LIV-1 family or its functional
CC homologue. The polypeptide is useful in the preparation of a medicament
CC for the treating a disease e.g. those involving disorders of zinc
CC homeostasis, in gene therapy and for modifying apoptosis in vitro or in
CC vivo on contact with cells. Diseases involving defects in zinc
CC homeostasis include cancer, neurodegenerative disorders and apoptotic
CC disorders. Recombinant proteins of the LIV-1 family (an oestrogen-
CC regulated gene) are useful for diagnosing a zinc homeostasis-related
CC condition in a subject which involves contacting a sample from the
CC subject with the recombinant protein and measuring the binding of a
CC antibody to the sample. The antibody is also useful for treating a zinc
CC homeostasis-related condition. This sequence is a member of the LIV-1
CC family (a gene regulated by oestrogen levels) and is useful for creating
CC recombinant proteins for diagnosing zinc-homeostasis related conditions,
CC described in the method of the invention

 DR New fusion protein for treating disease e.g. diabetes comprises an
 XX albumin fused to a therapeutic protein.
 XX Claim 1; Page 916-918; 2102pp; English.
 XX The present invention relates to albumin fusion proteins comprising a
 CC therapeutic protein X and human albumin (HA, also known as human serum
 CC albumin, HSA). The proteins are useful for treating a disease or disorder
 CC that may be modulated by therapeutic protein X. The albumin extends the
 CC shelf-life of protein X, and may increase its biological in vitro/in vivo
 CC activity. The protein is useful for treating and diagnosing disorders
 CC such as cancer, reproductive disorders, digestive disorders (e.g. Crohn's
 CC disease, ulcerative colitis), immune disorders (e.g. acquired
 CC immunodeficiency syndrome, AIDS), endocrine disorders (e.g. diabetes),
 CC haematopoietic disorders, neural disorders (e.g. Alzheimer's,
 CC Parkinson's, Creutzfeldt-Jacob disease, encephalomyelitis, meningitis,
 CC schizophrenia), and connective disorders (e.g. osteoporosis, arthritis).

 PT modulate the expression or activity of e.g. 1682, 6169 or 6193
 XX polypeptide or nucleic acid.
 PS Disclosure; SEQ ID NO 76; 328pp; English.
 XX The invention relates to a method for identifying a compound capable of
 CC treating a cardiovascular disorder. The present invention identifies the
 CC differential expression of 1682, 6169, 6193, 7771, 14395, 29002, 33216,
 CC 43726, 69292, 21656, 32427, 2402, 7747, 1720, 9151, 60491, 1371, 7077,
 CC 33207, 1419, 18036, 16105, 38650, 14245, 58848, 1870, 25856, 32394, 3484,
 CC 345, 9252, 9135, 10532, 18610, 8165, 2448, 2445, 64624, 84237, 8912,
 CC 2868, 283, 2354, 9464, 17799, 26686, 43848, 32135, 12208, 2914, 51130,
 CC 19489, 21833, 2917, 59590, 15992, 2094, 2252, 3474, 9792, 15400, 1452 or
 CC 6585 genes in cardiovascular disease states. The methods are useful in
 CC diagnosing, preventing and treating cardiovascular disorders, such as
 CC atherosclerosis, cardiac hypertrophy, ischaemia, reperfusion injury,
 CC restenosis, arterial inflammation, vascular wall remodeling, coronary
 CC microembolism, tachycardia, bradycardia, pressure overload, aortic
 CC bending, coronary artery ligation, vascular heart disease, valvular
 CC disease, including but not limited to, valvular degeneration caused by
 CC calcification, rheumatic heart disease, endocarditis, or complications of
 CC artificial valves; atrial fibrillation, long-QT syndrome, congestive
 CC heart failure, sinus node dysfunction, angina, heart failure,
 CC hypertension, atrial fibrillation, atrial flutter, pericardial disease,
 CC including but not limited to, pericardial effusion and pericarditis;
 CC cardiomyopathies, e.g. dilated cardiomyopathy or idiopathic
 CC cardiomyopathy, myocardial infarction, coronary artery disease, coronary
 CC artery spasm, ischaemic disease, arrhythmia, sudden cardiac death and
 CC cardiovascular developmental disorders. The methods may also be used for
 CC identifying compounds that modulate cardiovascular disorders. Sequences
 CC given in ADE31644-ADE31769 represent the genes and proteins that may be
 CC regulated by a compound of the invention.

XX Determining the presence or absence of a pathological cell in a patient,
 XX useful for diagnosing, prognosing or treating cancer, comprises detecting
 XX a nucleic acid in a biological sample.

XX Claim 12; SEQ ID NO C389; 1385pp; English.

XX The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
 XX whose expression is upregulated or downregulated in specific cancers or
 XX other diseases such as angiogenic or fibrotic disorders, and to methods
 XX of determining the presence or absence of a pathological cell in a
 XX patient by detecting a nucleic acid at least 80% identical to those of
 XX the invention or by detecting a polypeptide of the invention. The
 XX invention also relates to expression vectors and host cells comprising a
 XX nucleic acid of the invention; antibodies which specifically bind a
 XX polypeptide of the invention; use of such antibodies for drug targeting;
 XX and methods of screening for modulators of activity or expression of the
 XX polypeptides and nucleic acids. The nucleic acids, polypeptides,
 XX antibodies and methods are useful for diagnosing, prognosing and treating
 XX cancer and other conditions such as psoriasis, ischaemia, heart disease,
 XX atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
 XX neovascularization syndromes, scarring and uterine fibroids. They may
 XX also be useful in wound healing and in contraception. The present
 XX sequence represents a polypeptide of the invention.

XX New albumin fusion proteins, useful for diagnosing, treating, preventing
 XX or ameliorating diseases or disorders e.g. cancer, anemia, arthritis,
 XX asthma, inflammatory bowel disease or Alzheimer's disease.

XX Disclosure; SEQ ID NO 686; 279pp; English.

XX The invention relates to a novel albumin fusion protein. The invention
 XX further relates to: a composition comprising the albumin fusion protein
 XX and a pharmaceutical carrier; a kit comprising the composition of the
 XX albumin fusion protein formula; a method of treating a disease or
 XX disorder in a patient comprising the step of administering the albumin
 XX fusion protein; a method of treating a patient with a disease or disorder
 XX that is modulated by therapeutic protein: X, or its fragment or variant;
 XX a method of extending the shelf life of therapeutic protein: X, or its
 XX fragment or variant; a nucleic acid molecule comprising a polynucleotide
 XX sequence encoding the albumin fusion protein; a vector comprising the
 XX nucleic acid molecule of the albumin fusion protein; and a host cell
 XX comprising the nucleic acid molecule of the albumin fusion protein. The
 XX albumin fusion protein and its compositions have the following
 XX activities: cytostatic, antineoplastic, antiarthritic, antidiabetic, anti-
 XX HIV, immunosuppressive, antiinflammatory, antipsoriatic, antibacterial,
 XX osteopathic, dermatological, antigout, immunomodulator, antiarrhythmic,
 XX cardiant, nephrotropic, antiparkinsonian, tranquilizer, uropathic,
 XX neuroprotective, antiparkinsonian, tranquilizer, antidiabetic, anabolic,
 XX hypertensive, and vulnery. The albumin fusion protein nucleic acid may
 XX be used in gene therapy to treat disorders. The albumin fusion protein is
 XX useful for diagnosing, treating, preventing or ameliorating diseases or
 XX disorders comprising indication: Y. The diseases or disorders include:
 XX cancer (e.g. leukemia, colon, bone, breast, liver or lung cancer),
 XX immune or haematopoietic diseases (e.g. anemia, Hodgkin's disease, acute
 XX lymphocytic anaemia, multiple myeloma, arthritis, asthma, AIDS,
 XX autoimmune disease, inflammatory bowel disease, psoriasis or Lyme
 XX disease), reproductive system disorders (e.g. prostatitis, inguinal
 XX hernia, varicocele, penile carcinoma, ovarian adenocarcinoma or Sertoli-
 XX Leydig tumours), musculoskeletal diseases (e.g. giant cell tumours,

CC Paget's disease, systemic lupus erythematosus, gout, muscular dystrophy
 CC or cachexia), cardiovascular disease (e.g. rhabdomyomas, heart disease,
 CC arrhythmia, cardiac arrest, heat valve disease, hypernatraemia or
 CC hyponatraemia), mixed foetal diseases (e.g. foetal alcohol syndrome,
 CC Down's syndrome, Patau syndrome, Turner's syndrome, Apert syndrome or Tay
 CC -Sachs disease), excretory diseases (e.g. urinary incontinence, urinary
 CC tract infections or renal disorders), neural or sensory disease (e.g.
 CC Alzheimer's disease, Parkinson's disease, cerebral malaria, meningitis,
 CC cerebellar ataxia, attention deficit disorder, autism or obsessive
 CC compulsive disorder), respiratory disease (e.g. emphysema, lung cancer or
 CC occupational lung disease), endocrine diseases (e.g. diabetes, Addison's
 CC disease or glomerulonephritis), digestive diseases (e.g. portal
 CC hypertension, irritable bowel disease, gastric atrophy or pancreatitis)
 CC or connective tissue or epithelial diseases (e.g. Crohn's disease,
 CC scleroderma, wound healing or epidermolysis bullosa). This sequence
 CC represents a therapeutic protein X relating to the albumin fusion protein
 CC of the invention. The sequence listing data for this specification was
 CC downloaded from the USPTO website.

PS
XX
XX The invention relates to a snail (zinc finger protein) active regulator
CC (I) or epithelial mesenchymal transition (EMT) inducer (II) and encoding
CC polynucleotides (III). Also described are: a snail activation inhibitor
CC (AI) or EMT inhibitor (EI), being: an antisense oligonucleotide produced
CC by using (III) as a target, or a double-stranded RNA comprising a portion
CC of (III), and having the same or different sequence as that of (III); (I)
CC or (II) is useful for preparing a wound-healing agent and for treating
CC cancer. AI or EI is useful as an anti-inflammatory agent. (I) effectively
CC regulates snail activity. The present sequence represents a snail-related
CC protein of the invention. Note: This sequence is not shown in the
CC specification but was obtained in electronic format directly from WIPO at

PT New antisense nucleic acids, useful for identifying proteins or screening
PT for homologous nucleic acids required for cellular proliferation to
PT isolate candidate molecules for rational drug discovery programs.
XX
PS Claim 25; SEQ ID NO 77739; 1766pp; English.
XX
CC The invention relates to an isolated nucleic acid comprising any one of
CC the 6213 antisense sequences given in the specification where expression
CC of the nucleic acid inhibits proliferation of a cell. Also included are:
CC (1) a vector comprising a promoter operably linked to the nucleic acid
CC encoding a polypeptide whose expression is inhibited by the antisense
CC nucleic acid; (2) a host cell containing the vector; (3) an isolated
CC polypeptide or its fragment whose expression is inhibited by the
CC antisense nucleic acid; (4) an antibody capable of specifically binding
CC the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
CC proliferation or the activity of a gene in an operon required for
CC the gene product or that has an activity against a biological pathway
CC required for proliferation, or that inhibits cellular proliferation; (8)
CC identifying a gene required for cellular proliferation or the biological
CC pathway in which a proliferation-required gene or its gene product lies
CC or a gene on which the test compound that inhibits proliferation of an
CC organism acts; (9) manufacturing an antibiotic; (10) profiling a
CC compound's activity; (11) a culture comprising strains in which the gene
CC product is overexpressed or underexpressed; (12) determining the extent
CC to which each of the strains is present in a culture or collection of
CC strains; or (13) identifying the target of a compound that inhibits the
CC proliferation of an organism. The antisense nucleic acids are useful for
CC identifying proteins or screening for homologous nucleic acids required
CC for cellular proliferation to isolate candidate molecules for rational
CC drug discovery programs, or for screening homologous nucleic acids
CC required for proliferation in cells other than *S. aureus*, *S. typhimurium*,
CC *K. pneumoniae* or *P. aeruginosa*. The present sequence is encoded by one of
CC the target prokaryotic essential genes. Note: The sequence data for this
CC patent did not form part of the printed specification, but was obtained
CC in electronic format directly from WIPO at
CC ftp.wipo.int/pub/published_pct_sequences

CC sequences. (I) is useful as hybridisation probes, polymerase chain
CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
CC and in recombinant production of (II). The polynucleotides are also used
CC in diagnostics as expressed sequence tags for identifying expressed
CC genes. (I) is useful in gene therapy techniques to restore normal
CC activity of (II) or to treat disease states involving (II). (II) is
CC useful for generating antibodies against it, detecting or quantitating a
CC polypeptide in tissue, as molecular weight markers and as a food
CC supplement. (II) and its binding partners are useful in medical imaging
CC of sites expressing (II). (I) and (II) are useful for treating disorders
CC involving aberrant protein expression or biological activity. The
CC polypeptide and polynucleotide sequences have applications in
CC diagnostics, forensics, gene mapping, identification of mutations
CC responsible for genetic disorders or other traits to assess biodiversity
CC and to produce other types of data and products dependent on DNA and
CC amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic
CC amino acid sequences of the invention. Note: The sequence data for this
CC patent did not appear in the printed specification, but was obtained in
CC electronic format directly from WIPO at

XX
XX New antisense nucleic acids, useful for identifying proteins or screening
PT for homologous nucleic acids required for cellular proliferation to
PT isolate candidate molecules for rational drug discovery programs.
XX
XX Claim 25; SEQ ID NO 61545; 1766pp; English.
XX
XX The invention relates to an isolated nucleic acid comprising any one of
CC the 6213 antisense sequences given in the specification where expression
CC of the nucleic acid inhibits proliferation of a cell. Also included are:
CC (1) a vector comprising a promoter operably linked to the nucleic acid
CC encoding a polypeptide whose expression is inhibited by the antisense
CC nucleic acid; (2) a host cell containing the vector; (3) an isolated
CC polypeptide or its fragment whose expression is inhibited by the
CC antisense nucleic acid; (4) an antibody capable of specifically binding
CC the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
CC proliferation or the activity of a gene in an operon required for
CC proliferation; (7) identifying a compound that influences the activity of
CC the gene product or that has an activity against a biological pathway
CC required for proliferation, or that inhibits cellular proliferation; (8)
CC identifying a gene required for cellular proliferation or the biological
CC pathway in which a proliferation-required gene or its gene product lies
CC on a gene on which the test compound that inhibits proliferation of an
CC organism acts; (9) manufacturing an antibiotic; (10) profiling a
CC compound's activity; (11) a culture comprising strains in which the gene
CC product is overexpressed or underexpressed; (12) determining the extent
CC to which each of the strains is present in a culture or collection of
CC strains; or (13) identifying the target of a compound that inhibits the
CC proliferation of an organism. The antisense nucleic acids are useful for
CC identifying proteins or screening for homologous nucleic acids required
CC for cellular proliferation to isolate candidate molecules for rational
CC drug discovery programs, or for screening homologous nucleic acids
CC required for proliferation in cells other than S. aureus, S. typhimurium,
CC K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of
CC the target prokaryotic essential genes. Note: The sequence data for this
CC patent did not form part of the printed specification, but was obtained
CC in electronic format directly from WIPO at

 New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
 Claim 1; SEQ ID NO 8373; 122pp; English.
 The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant having an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at seqdata.uspto.gov/sequence.html.

 XX Novel polynucleotides derived from Corynebacterium bacteria, for identifying
 PT mutation point of a gene, measuring expression of a gene, analyzing
 PT expression profile or pattern of a gene and identifying homologous gene.
 XX
 PS Claim 17; SEQ ID NO 5445; 246pp + Sequence Listing; English.
 XX The present invention provides a number of nucleotide and protein
 CC sequences from the Corynebacterium bacterium Corynebacterium glutamicum. These
 CC are useful for identifying the mutation point of a gene derived from a
 CC mutant of corynebacterium bacterium, measuring expression amount and analysing
 CC the expression profile or expression pattern of a gene derived from
 CC Corynebacterium bacterium, and identifying a homologue of a gene derived from
 CC corynebacterium bacterium. Corynebacterium bacteria are useful for producing amino
 CC acids, nucleic acids, vitamins, saccharides and organic acids,
 CC particularly L-lysine. The present sequence is a protein described in the
 CC exemplification of the invention. Note: The sequence data for this patent
 CC did not form part of the printed specification, but was obtained in

 PT Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, f
 PT useful as molecular targets for diagnostics, prophylaxis and treatment of
 PT pathological conditions resulting from bacterial infection.
 XX
 PS Disclosure; SEQ ID NO 31967; 455pp; English.

XX The invention relates to *Pseudomonas aeruginosa* polypeptides and the
CC polynucleotides encoding them. The sequences are useful in diagnosis and
CC therapy of pathological conditions, as molecular targets for diagnostics,
CC prophylaxis and treatment of pathological conditions resulting from a
CC bacterial infection, for evaluating a compound, such as a polypeptide,
CC for the ability to bind a *P. aeruginosa* nucleic acid, as components of
CC effective antibacterial targets, as targets for antibacterial drugs,
CC including anti-*P. aeruginosa* drugs, as templates for recombinant
CC production of *P. aeruginosa*-derived peptides or polypeptides, as target
CC components for diagnosis and/or treatment of *P. aeruginosa*-caused
CC infection, and in detection of *P. aeruginosa* sequences or other sequences
CC of *Pseudomonas* species using biochip technology. Sequences AB067826-
CC AB084396 represent *P. aeruginosa* polypeptides of the invention. Note: The
CC sequence data for this patent did not form part of the printed
CC specification but was obtained in electronic format from USPTO at

XX New diagnostic and therapeutic polynucleotides and polypeptides, useful
PT in diagnosing a condition, disease or disorder associated with human
FT molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or
PT in gene mapping.

XX Claim 27; Page; 190pp; English.

XX The invention relates to novel diagnostic and therapeutic polynucleotides
CC selected from one of the 2722 sequences defined in the specification. A
CC polynucleotide of the invention may have a use in gene therapy. The human
CC diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be
CC used to diagnose a particular condition, disease or disorder associated
CC with human molecules, e.g. cell proliferative disorders,
CC autoimmune/inflammatory disorder, developmental disorder, endocrine
CC disorder, neurological disorders, gastrointestinal disorders, or
CC infections caused by virus, bacteria, fungi or parasite. The dithp
CC molecules may also be used in genetic mapping, in identifying individuals
CC from minute biological samples, in detecting single nucleotide
CC polymorphisms, as molecular weight markers, and for somatic or germline
CC gene therapy. The present sequence represents a dithp protein of the
CC invention. Note: The sequence data for this patent is not represented in
CC the printed specification, but was obtained in electronic format directly

XX The invention relates to a recombinant DNA construct comprising a
CC promoter functional in a plant cell, where the promoter is positioned to
CC provide for expression of a polynucleotide encoding a polypeptide from a
CC microbial source. The invention also relates to a transformed plant
CC comprising the recombinant DNA construct and a method of producing a
CC transformed plant having an improved property. The plant is a crop plant
CC such as maize or soybean. The method of producing a transformed plant
CC having an improved property comprises transforming a plant with the
CC recombinant DNA construct and growing the transformed plant, where the
CC polynucleotide or polypeptide is useful for improving plant properties.
CC The recombinant DNA construct is useful for producing plants with
CC improved plant properties, e.g. improved cold, heat or drought tolerance,
CC tolerance to herbicides, extreme osmotic conditions, pathogens or pests,
CC increased resistance to plant disease, better growth rate by modification
CC of the cell cycle pathway with plant growth regulators, increased rate of
CC homologous recombination, modified seed oil or protein yield and/or
CC content, improved yield by modification of carbohydrate, nitrogen or
CC phosphorus use and/or uptake, by modification of photosynthesis or by
CC providing improved plant growth and development under at least one stress
CC condition, improved lignin production or improved galactomannan
CC production. This sequence represents a bacterial polypeptide used in the
CC scope of the invention. Note: The sequence data for this patent did not
CC form part of the printed specification but was obtained in electronic
CC format from USPTO at seqdata.uspto.gov/sequence.html.

 XX CC The present invention describes an isolated polynucleotide (I) of
 CC CC Alloiococcus otitis genomic DNA, which encodes an antigenic protein.
 CC CC Alloiococcus otitis is a Gram-positive bacterium. Also described: (1)
 CC CC an isolated polypeptide that is encoded by the polynucleotide (I); (2) an
 CC CC expression vector comprising the novel isolated polynucleotide (I), its
 CC CC complement, degenerate variant or fragment; (3) a genetically engineered
 CC CC host cell, transfected, transformed or infected with the vector of (2);
 CC CC (4) an antibody specific for the polypeptide of (1); (5) an immunogenic
 CC CC composition comprising the polypeptide, its complement, biological
 CC CC equivalent or fragment, or the polynucleotide that is comprised in the
 CC CC expression vector; (6) a pharmaceutical composition comprising the
 CC CC polypeptide of (1) and a carrier; (7) a protein chip comprising an array
 CC CC of the polypeptides of (1), their biological equivalent or fragment; (8)
 CC CC immunising against Alloiococcus otitis by administering to a host the
 CC CC immunogenic composition; (9) detecting and/or identifying Alloiococcus
 CC CC otitis in the biological sample; (10) a kit comprising a container
 CC CC containing the novel polynucleotide, its degenerate variant or fragment,
 CC CC or the antibody of (4), and (11) producing a polypeptide by culturing the
 CC CC genetically engineered host cell under conditions suitable to produce the
 CC CC polypeptide from the culture. (I) can be used in gene therapy. The
 CC CC polynucleotides, polypeptides, antibodies and compositions of the present
 CC CC invention can be used for treating and diagnosing diseases, drug
 CC CC screening assays and monitoring of effects during drug clinical trials.
 CC CC The polynucleotides are useful for expressing and detecting Alloiococcus
 CC CC otitis. The present sequence represents an Alloiococcus otitis
 CC CC antigen protein from the present invention.

XX

CC The invention discloses a polynucleotide comprising a sequence selected

CC from 1970 fully defined nucleotide sequences which encode novel

CC polypeptides. Also claimed is a polypeptide encoded by the polynucleotide

CC or its partial peptide, an antibody binding to the polypeptide or peptide

CC of the polynucleotide, immunologically assaying the polypeptide or

CC peptide of the polynucleotide by contacting the polypeptide or peptide

CC with the antibody of the encoded protein, and observing the binding

CC between the two, a transformant carrying the polynucleotide in an

CC expressible manner and an antisense polynucleotide. The oligonucleotide

CC is useful as a primer for synthesising the polynucleotide, or as a probe

CC for detecting the polynucleotide. The polynucleotides and encoded

CC proteins are useful as pharmaceutical agents and many disease-related

CC genes may be included in them, for developing a diagnostic marker or

CC medicines for regulation of their expression and activity, or as targets

CC of gene therapy. The genes are involved in tissue and/or cell

CC regeneration. Membrane proteins, signal transduction-related proteins,

CC transcription-related proteins, disease-related proteins and genes

CC encoding them can be used as indicators for diseases (e.g. osteoporosis,

CC neurological diseases, cancer, tumours. The cDNA may be used to regulate

CC the activity or expression of the encoded protein to treat diseases. The

CC sequence presented is a protein of the invention. Note: Some of the

CC sequence data for this patent is not represented in the printed

CC specification, but is based on sequence information supplied by the

CC European Patent Office.

XX New antisense nucleic acids, useful for identifying proteins or screening

PT for homologous nucleic acids required for cellular proliferation to

PT isolate candidate molecules for rational drug discovery programs.

XX Claim 25; SEQ ID NO 49664; 1766pp; English.

XX The invention relates to an isolated nucleic acid comprising any one of

XX the 6213 antisense sequences given in the specification where expression

CC of the nucleic acid inhibits proliferation of a cell. Also included are:

CC (1) a vector comprising a promoter operably linked to the nucleic acid

CC encoding a polypeptide whose expression is inhibited by the antisense

CC nucleic acid; (2) a host cell containing the vector; (3) an isolated

CC polypeptide or its fragment whose expression is inhibited by the

CC antisense nucleic acid; (4) an antibody capable of specifically binding

CC the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular

CC proliferation or the activity of a gene in an operon required for

CC proliferation; (7) identifying a compound that influences the activity of

CC the gene product or that has an activity against a biological pathway

CC required for proliferation, or that inhibits cellular proliferation; (8)

CC identifying a gene required for cellular proliferation or the biological

CC pathway in which a proliferation-required gene or its gene product lies

CC or a gene on which the test compound that inhibits proliferation of an

CC organism acts; (9) manufacturing an antibiotic; (10) profiling a

CC compound's activity; (11) a culture comprising strains in which the gene

CC product is overexpressed or underexpressed; (12) determining the extent

CC to which each of the strains is present in a culture or collection of

CC strains; or (13) identifying the target of a compound that inhibits the

CC proliferation of an organism. The antisense nucleic acids are useful for

CC identifying proteins or screening for homologous nucleic acids required

CC for cellular proliferation to isolate candidate molecules for rational

CC drug discovery programs, or for screening homologous nucleic acids

CC required for proliferation in cells other than *S. aureus*, *S. typhimurium*,

CC *K. pneumoniae* or *P. aeruginosa*. The present sequence is encoded by one of

CC the target prokaryotic essential genes. Note: The sequence data for this

CC patent did not form part of the printed specification, but was obtained

CC in electronic format directly from WIPO at

XX New nucleic acid encoding variant forms of DNA-replication, ribosome and

PT pathogenesis proteins, useful for production of fine chemicals,

PT specifically lysine, in microorganisms.

XX Claim 1; SEQ ID NO 44; 259pp; German.
 PS This invention describes novel DNA-replication, ribosome and pathogenesis
 CC proteins from *Corynebacterium glutamicum*, involved directly or indirectly
 CC in formation of fine chemicals. The proteins are isolated from a nucleic
 CC acid library of *C. glutamicum* then mutated at specified positions, cloned
 CC and expressed by standard methods. Cells containing vectors that express
 CC the proteins are used for production of fine chemicals, preferably amino
 CC acids and specifically lysine, but more generally nucleotides,
 CC nucleosides, lipids, fatty acids, diols, carbohydrates, aromatic
 CC compounds, vitamins, co-factors and enzymes. These are useful in the
 CC food, animal feed, cosmetics and pharmaceutical industries. The encoding
 CC polynucleotides optionally as primers and probes, can also be used for
 CC identification and classification of *C. glutamicum* and related species,
 CC e.g. for diagnosis, for genomic mapping, functional or evolutionary
 CC studies, gene manipulation and modulation of metabolic activity. ADJ87344
 CC -ADJ87439 represent *C. glutamicum* DNA-replication, ribosome and
 CC pathogenesis-associated polynucleotides and polypeptides described in the
 CC disclosure of the invention.

 PT New nucleic acid encoding variant forms of marker and fine chemical-
 PT production proteins, useful for production of fine chemicals,
 PT specifically lysine, in microorganisms.
 XX
 PS Claim 1; Page; 20pp; German.
 XX
 CC This invention describes novel polynucleotides that encode protein
 CC markers and fine chemical-production proteins from *Corynebacterium*
 CC glutamicum. The polynucleotides are isolated from a nucleic acid library

CC of *C. glutamicum* then mutated at the specified positions, cloned and
 CC expressed by standard methods. Cells, especially *Corynebacterium*
 CC glutamicum, containing vectors that express the polynucleotides are used
 CC for production of fine chemicals, preferably amino acids and specifically
 CC lysine, but more generally nucleotides, nucleosides, lipids, fatty acids,
 CC diols, carbohydrates, aromatic compounds, vitamins, co-factors and
 CC enzymes. These are useful in the food, animal feed, cosmetics and
 CC pharmaceutical industries. The polynucleotides, optionally as primers and
 CC probes, can also be used for identification and classification of *C.*
 CC glutamicum and related species, e.g. for diagnosis, for genomic mapping,
 CC functional or evolutionary studies, gene manipulation and modulation of
 CC metabolic activity. Cells that containing the polynucleotides of the
 CC invention may produce fine chemicals in better yields, with higher
 CC productivity and/or more efficiently. NOTE: This sequence is not
 CC represented in the printed specification but is available in electronic
 CC format. The sequence represented in this record has been obtained from
 CC WO2003046123.

 PT New synthetic polypeptides having several different segments of at least
 PT one parent polypeptide linked together differently compared to the
 PT linkage in the parent polypeptide, for inducing immune response against a
 PT pathogen or cancer.
 XX
 PS Example 2; SEQ ID NO 814; 364pp; English.
 XX
 CC The invention relates to a new synthetic polypeptide (I) comprising
 CC several different segments of at least one parent polypeptide linked
 CC together in a different relationship relative to their linkage in the
 CC parent polypeptide to impede, abrogate or otherwise alter at least one
 CC function associated with the parent polypeptide and for inducing an

CC immune response against a pathogen or cancer. Also included are a
 CC synthetic polynucleotide encoding and a computer system for designing the
 CC synthetic polypeptides. The synthetic polypeptides and polynucleotides
 CC are referred to as a vaccine. The synthetic polypeptide is useful for
 CC modulating immune responses preferably directed against a pathogen or a
 CC cancer, (e.g., cancers of the lung, breast, ovary, cervix, colon, head
 CC and neck, pancreas, prostate, stomach, bladder, kidney, bone liver,
 CC oesophagus, brain, testicle, uterus), as potentiating agents.
 CC Compositions comprising the polypeptide may be used in the treatment or
 CC prophylaxis against viral (such as infections caused by HIV (human
 CC immunodeficiency virus), hepatitis, influenza, Japanese encephalitis
 CC virus, Epstein-Barr virus and respiratory syncytial virus), bacterial
 CC (e.g., infections caused by Neisseria, Meningococcal, Haemophilus,
 CC Salmonella, Streptococcal, Legionella and Mycobacterium) or parasitic
 CC (e.g., infections caused by Plasmodium, Schistosoma, Leishmania,
 CC Trypanosoma, Toxoplasma and Giardia) infections. The present sequence is
 CC a cassette protein consisting of several peptides derived from a parent
 CC protein. One or more cassettes are used to construct a vaccine of the
 CC invention

PT Identification of stress induced genes for determining risk and
 PT preventing, treating or controlling osteoporosis.

XX Claim 32; Fig 14A-T; 308pp; English.

XX The present sequence is obtained from a clustal X alignment with protein
 CC 274. Protein 274 was identified using the method of the invention after
 CC subjecting rat osteoblasts to mechanical stress. Expression of the 608
 CC gene was found to be upregulated by about 3-fold in cells subjected to
 CC mechanical strain. The specification describes a method for the
 CC identification of genes responsive to a specific mechanical stress. The
 CC method comprises applying the mechanical stress to an organism (tissue or
 CC cells comprising bone cells), isolating the specific cellular fractions

CC and extracting mRNA from them, and differentially analysing the mRNA in
 CC comparison with control samples. The method is used to identify genes
 CC whose expression is responsive to a specific stress. The identified genes
 CC are employed in determining risk associated with a physiological or
 CC disease state. The risk determination methods are used for testing a
 CC medicament for gene therapy. These medicaments, or genes identified by
 CC the method of the invention, are used for treating, preventing or
 CC controlling a physiological or disease state (especially osteoporosis or
 CC bone density or other factors causing or contributing to osteoporosis or
 CC its symptoms or other conditions involved in mechanical stress or its
 CC lack. The methods can also be used for advancing research or studies in
 CC bone development

PT New complex between two interacting proteins in adipocyte cells, useful
 PT for identifying selected interacting domains that modulate protein
 PT interactions, or for preventing or treating metabolic disorders such as
 PT obesity or diabetes.

XX Claim 6; Page 134-137; 382pp; English.

XX The invention relates to a complex between two interacting proteins in
 CC adipocyte cells, given in the specification. The proteins are identified
 CC by selecting a bait protein from a known adipocyte marker and then
 CC performing a yeast 2-hybrid selection to isolate prey proteins encoded by
 CC members of an adipocyte cDNA library. The proteins are designated as a
 CC (RIM) (selected interacting domains) proteins. Also included are a
 CC polynucleotide encoding a polypeptide in the adipocyte cells, a
 CC recombinant host cell expressing at least one of the interacting
 CC polypeptides of the complex, selecting a modulating compound in adipocyte
 CC cells, a SID (RIM) polypeptide comprising any of the 738 amino acid
 CC sequences given in the specification (including its fragment or variant),

XX PS Example 4; SEQ ID NO 257; 107pp; English.

XX CC The invention relates to novel isolated human secreted polypeptides (I) and polynucleotides (II). (I) and (II) are useful for treating inflammatory conditions such as arthritis, nephritis, Crohn's disease, ischaemia-reperfusion injury, shock, sepsis, immune responses, and is involved in increasing haematopoiesis, stem cell survival, bone growth and remodeling. (I), (II) and modulators of (II) are useful for prophylaxis or treatment of one or more cancers. (II) is also useful for creating transgenic animals useful for studying the in vivo activities of the polypeptide as well as for studying modulators of the polypeptides. (I) induces the proliferation of neural cells and regeneration of nerve and brain tissue and is useful for the treatment of central and peripheral nervous system diseases and neuropathies, such as Alzheimer's, Parkinson's disease, Huntington's disease, and amyotrophic lateral sclerosis. In addition, (I) is involved in chemotactic or chemokinetic activity, regulation of haematopoiesis and is useful for treating myeloid or lymphoid cell disorders, platelet disorders such as thrombocytopenia and for regeneration of bone, cartilage, tendon, ligament and/or nerve tissue growth, and in tissue repair, healing of burns, incisions, ulcers, for treating osteoporosis, osteoarthritis, bone degenerative disorders, or periodontal disease. Furthermore, (I) is also useful for gut protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues, various immune deficiencies and disorders including severe combined immunodeficiency (SCID), bacterial or fungal infections, autoimmune disorders e.g. multiple sclerosis, rheumatoid arthritis, diabetes mellitus, myasthenia gravis, allergic reactions and conditions, such as asthma or other respiratory problems. In addition, (I) affects biorythms or circadian cycles of rhythms, fertility, metabolism, catabolism, anabolism, storage or elimination of dietary fat, lipid, protein, carbohydrate, vitamins, minerals, provides analgesic effects or other pain reducing effects, immunoglobulin like activity and can act as an antigen in a vaccine composition to raise an immune response. AAU28020-AAU28395 represent novel human secreted protein amino acid sequences of the invention

 XX PT Novel peptide, comprising a contiguous amino acid sequence of a viral protein, capable of binding to a region of cellular protein AP-50 is useful for treating viral infections.
 XX PS Example 3; SEQ ID NO 13; 60pp; English.
 XX CC The invention relates to a novel isolated peptide comprising a contiguous amino acid sequence of 7-30 amino acid residues of a viral protein, where the contiguous amino acid sequence encompasses the YPXL motif of the viral protein, and the 7-30 amino acid viral protein is capable of binding a region including the amino acid residues 121-435 of cellular protein AP-50. The isolated 7-30 amino acid viral protein is selected from Hepatitis C virus (HCV) polyprotein, herpes simplex virus (HSV) UL42 protein, variola virus A10L protein, vaccinia virus virion core protein Pxa, and human parainfluenza virus haemagglutinin-neuraminidase, where the contiguous amino acid sequence encompasses the YPXL motif of the viral protein. The peptides of the invention are useful in the manufacture of a medicament for treating viral infections caused by a virus selected from HCV, HSP-1 and variola virus. The peptides are also useful for inhibiting viral budding from virus-infected cells and/or inhibiting viral infectivity, thus inhibiting viral propagation in the cells. This sequence represents the protein of a Hepatitis C virus used in the treatment of viral infections of the invention.

XX New nucleic acid comprising a chimeric bovine viral diarrhoea virus genome
PT in which the (non-)structural region has been replaced by hepatitis C
PT virus (HCV) genome useful for treating or preventing HCV signs and
PT symptoms.
XX Disclosure; Page 85-97; 97pp; English.
XX The specification describes a nucleic acid comprising a chimeric virus
CC genome, specifically bovine viral diarrhoea virus (BVDV) genome in which
CC the (non-)structural region has been replaced by the (non-)structural
CC region of a hepatitis C virus (HCV) genome. The nucleic acids comprising
CC the chimeric virus and the chimeric virus are useful for identifying cell
CC
lines capable of supporting the replication of these chimeric viruses, in
CC screening for neutralizing antibodies to HCV of different genotypes, in
CC the production of HCV-BVDV virions, for the development of inactivated or
CC attenuated vaccines to prevent HCV-BVDV in a mammal, in studying the
CC molecular properties of HCV indirectly in vitro, and in identifying
CC inhibitors of viral enzyme activity which would be useful as antiviral
CC agents. Formulations or compositions comprising the chimeric virions may
CC be used to treat or prevent the signs and symptoms of HCV. The present
CC sequence is encoded by a HCV clone, which is used to construct chimeric
CC nucleic acids of the invention

XX Novel replicon RNA, having sequence of 5' and-3' untranslated region and
XX base sequence encoding NS3, NS4A, NS4B, NS5A and NS5B proteins on genomic
XX RNA of hepatitis C virus of genotype 2a, useful for treating hepatitis C
XX virus infection.
XX Disclosure; SEQ ID NO 6; 197pp; Japanese.
XX The invention relates to replicon RNA from genotype 2a of hepatitis C
XX virus comprising a 5' untranslated region, a base sequence encoding NS3
XX protein, NS4A protein, NS4B protein, NS5A protein and NS5B protein, and a
XX 3' untranslated region. The invention also relates to a cell capable of
XX reproducing the replicon involving transducing the replicon RNA to a
XX cell, a method of producing a hepatitis C virus protein, a method of
XX screening a substance that promotes or suppresses the reproduction of
XX hepatitis C virus, involving culturing the replicon reproducing cell in
XX the presence of a test substance, and detecting the reproduction of
XX replicon RNA in the culture. Virucide. The replicon RNA is useful for
XX producing a replicon reproduction cell and for increasing the
XX reproduction efficiency of replicon RNA of hepatitis C virus of genotype
XX 2a. The cell and the replicon RNA are useful for producing a therapeutic
XX agent or a diagnostic agent for hepatitis C virus infection, for
XX producing a vaccine against hepatitis C virus infection and for screening
XX a substance that promotes or suppresses the reproduction of hepatitis C
XX virus. This sequence represents a hepatitis C virus (HCV) protein used in
XX the scope of the invention.

XX PT Identification of stress induced genes for determining risk and
XX preventing, treating or controlling osteoporosis.

XX PS Claim 32; Fig 13; 308pp; English.

XX CC The present sequence represents protein 274, which was identified using
XX the method of the invention after subjecting rat osteoblasts to
XX mechanical stress. Expression of the 274 gene was found to be upregulated
XX by about 3-fold in cells subjected to mechanical strain. The
XX specification describes a method for the identification of genes
XX responsive to a specific mechanical stress. The method comprises applying
XX the mechanical stress to an organism (tissue or cells comprising bone
XX cells), isolating the specific cellular fractions and extracting mRNA
XX from them, and differentially analysing the mRNA in comparison with
XX control samples. The method is used to identify genes whose expression is
XX responsive to a specific stress. The identified genes are employed in
XX determining risk associated with a physiological or disease state. The
XX risk determination methods are used for testing a medication for gene
XX therapy. These medications, or genes identified by the method of the
XX invention, are used for treating, preventing or controlling a
XX physiological or disease state (especially osteoporosis or bone density
XX or other factors causing or contributing to osteoporosis or its symptoms
XX or other conditions involved in mechanical stress or its lack. The
XX methods can also be used for advancing research or studies in bone
XX development

XX CC New microtubule associated factor 600 protein, useful for preparing a
XX CC composition for treating cancer e.g., retinoblastoma, osteosarcoma, or
XX CC lung, breast or bladder cancer.
XX CC Claim 1; Fig 1b; 75pp; English.
XX CC The invention relates to microtubule-associated factor 600 (MTAF600), a
XX CC 600kDa subunit of retinoblastoma (RB) polypeptide complex. RB is a tumour
XX CC suppressor and its major role is repression of E2F family of DNA-binding
XX CC transcriptional activators, which regulate cell cycle through various
XX CC genes required for S-phase entry. MTAF600 interacts directly with RB and
XX CC microtubules and plays a role in active repression of E2F-responsive
XX CC genes, cell cycle arrest and genomic stability. The pharmaceutical
XX CC composition comprising the polypeptide of the invention is useful for
XX CC treating hyperproliferative condition, particularly cancer such as
XX CC retinoblastoma, osteosarcoma, lung, breast or bladder cancer. The present
XX CC sequence is human MTAF600 polypeptide

XX Biomarkers useful for predicting or determining the response of a mammal
XX to a cancer treatment comprising administration of a modulator of cyclin-
XX dependent kinase activity.
XX Claim 5; SEQ ID NO 719; 141pp; English.
XX This invention describes a novel method of predicting or determining
XX whether a mammal will respond or is responding to an anti-cancer agent
XX that modulates cyclin-dependent kinase (cdk) activity. The method agent
XX comprises measuring the level of one or more biomarkers selected from
XX 2774 biomarkers given in the specification (nucleotide sequence SEQ ID
XX NO:1246 (Genbank EST W28729) is especially preferred). The method of the
XX invention is utilized in a kit for determining or predicting whether
XX patient would be susceptible or resistant to treatment by an agent
XX modulating cdk activity. The invention also describes a method for
XX utilizing individualized genetic profiles for treating diseases and
XX disorders based on patient's response and molecular level, specialized
XX microarrays comprising the biomarkers described, antibodies directed
XX against the biomarkers and a cell culture model to identify biomarkers.
XX The cdk modulator is preferably N-5-[(5-(1,1-dimethylethyl)-2-
XX oxazolyl)methylthio]-2-thiazolyl-4-piperidine carboxamide, 0.5-L-
XX tartaric acid salt. Note: The sequence data for this patent did not form
XX part of the printed specification, but was obtained in electronic format
XX directly from WIPO at ftp.wipo.int/pub/published_pct_sequences. This
XX sequence represents a biomarker used in the method of the invention.
